

The Chicken and the Egg: Open Data to Support Research Data

Dr. Rachael Lammey, CrossRef, Oxford, GB

Policies, best practices, initiatives, and projects to support the citation and sharing of research data are on the up. As they should be - the curation, sharing, and citation of research data and its relation to other research outputs supports a host of potential benefits. It also provides an opportunity to think about how we measure the use and reuse of research data, what that might mean and how open the data should be around that use and reuse, and what the data about the data means. I'll talk about how developing this understanding alongside other data-related initiatives is key to supporting data correctly within the research ecosystem.
