

Supplementary Figure 1

Supplementary Figure 1. Representative dose response curves of BSO (Black circles), L-PAM (Open circle), and BSO + L-PAM (Black triangle) in 9 MM cell lines at 20 % oxygen tension. Drug concentrations were 0 - 400 μM for BSO and 0 - 50 μM for L-PAM (Fixed ratio 8:1). No substantial difference in cytotoxicity was seen compared to 5% oxygen tension in all cell lines tested. The survival fraction was determined by mean fluorescence of the treated cells/mean fluorescence of control cells. Each condition had > 3 replicates and error bars represent standard deviation.
