

## Supplementary Figure 1

**Supplementary Figure 1 | Adenovirus-mediated expression of AdipoR1 or AdipoR2 in the liver of *db/db* mice.**

**a-g**, plasma glucose during adiponectin sensitivity test (30 µg/10g body weight) (**a**), amounts of AdipoR1 (**b,c** top) or AdipoR2 (**b,c** bottom) protein in liver lysates (**b**) or liver membrane fractions (**c**), area under the glucose curves (AUC) during the oral glucose tolerance test (OGTT) (**d,e**), serum free fatty acid (FFA) levels (**f,g**) under the fed state (**f,g** left) or fasted state (**f,g** right), from wild-type (WT) (**a-g**) or adiponectin knockout (Adipo-KO) (**d,e**) wild-type (**a**) or *db/db* mice (**b-g**) infected with an adenovirus expressing LacZ or AdipoR1<sup>1.5X</sup> or AdipoR2 at a concentration of 1 x 10<sup>8</sup> plaque-forming units (pfu) per gram of body weight. The results are expressed as the percent of the value of adenoviruses expressing LacZ-infected mice (**d,e**) or time 0 (**a**). Each bar represents the mean ± s.e.m. (*n* = 4-10 per condition). (\*, *P* < 0.05; NS, there was no significant difference; between two groups, as indicated, or versus LacZ).
