

RNA polymerase III

Supplementary Figure 1. Pol-III ChIP antibody specificity. Specific subunits recognized by ChIP antibodies have been highlighted (yellow). A- and B- boxes are initially recognized by the multisubunit complex, TFIIC. Once bound, TFIIC recruits the three subunit complex TFIIB whose promoter association signals the recruitment of RNA Pol-III. Primers for miR-515-l, -517a and -519a (**Supplementary Table 5** online) were used to ascertain the polymerase occupancy of representative miRNAs in the C19MC.
