

Supplementary information

The single-cell pathology landscape of breast cancer

In the format provided by the authors and unedited

Hartland W. Jackson, Jana R. Fischer, Vito R. T. Zanutelli, H. Raza Ali, Robert Mechera, Savas D. Soysal, Holger Moch, Simone Muenst, Zsuzsanna Varga, Walter P. Weber & Bernd Bodenmiller

SI Guide

The SI file contains example images from the analyzed cohort and Supplementary Tables 1-9. The Supplementary Tables yield an overview over the clinical and patient information and summarize the output of statistical analyses.

Supplementary Images:

Supplementary Images 1: Summary example images from different patients of the analyzed cohort; **(top)** 6-color image of representative markers, **(bottom)** same image with single-cells colored by cell type metacluster overlaid with an example **(a)** epithelial or **(b)** microenvironment community type contained frequently in the respective image. Each marker was individually scaled to enable visualization. Scale bar = 100 μm .

Supplementary Images 2: Example images from different patients of the analyzed cohort, each highlighting an individual epithelial or microenvironment community type. Scale bar = 100 μm .

Supplementary Images 3: Example images representing a tumor from each SCP subgroup. **(left)** 6-color image of representative markers, **(right)** same image with single-cells colored by cell type metacluster. Scale bar = 100 μm .

Supplementary Information Tables:

Supplementary Table 1: Overview of patient clinical metadata for cohort from University Hospital Basel including tumor grade; TNM score (tumor size and invasion, lymph nodal involvement, distant metastasis); overall and disease-free survival; immunohistochemistry classification of ER, PR, and HER2 receptors; and clinical subgroup.

Supplementary Table 2: Antibody conjugates used in staining panel.

Supplementary Table 3: Summary of clinical parameters for each single-cell pathology subgroup.

Supplementary Table 4: **(a-c)** Coxph and **(d-f)** logrank tests for differences in overall survival between each single-cell pathology subgroup and the rest of the patients **(a, d)** in the cohort, **(b, e)** in similar SCP subgroups, and **(c, f)** in the patients clinically categorized as HR⁺/HER2⁻.

Supplementary Table 5: **(a)** Coxph and **(b)** logrank tests for differences between disease-free survival of each single-cell pathology subgroup and the rest of the patients in the cohort.

Supplementary Table 6: **(a)** Coxph and **(b)** logrank tests for differences between overall survival of stromal environment subgroup and the rest of the patients in the cohort.

Supplementary Table 7: **(a)** Coxph and **(b)** logrank tests of differences between disease-free survival of stromal environment subgroup and the rest of the patients in the cohort.

Supplementary Table 8: Likelihood ratio tests between nested coxph models. The null hypothesis is that the larger model (more variables) is not better than the smaller one. P values < 0.05 reject the null hypothesis.

Supplementary Table 9: Overview of patient clinical metadata for cohort from University Hospital Zurich.
