Structural Parameters

All the polycrystalline samples of $R\text{FeAs}_{1-x}(\text{P/Sb})_x\text{O}_{1-y}(\text{F/H})_y$ ($R = \text{La}$ and Nd) were characterized by synchrotron X-ray diffraction. Figure S1 shows the x -dependence of the lattice constants a and c , the pnictogen (Pn) height from the Fe-layer (h_{Pn}), the Pn -Fe- Pn bond angle (α), and the Fe- Pn bond distance ($d_{\text{Fe}-Pn}$) in $R\text{FeAs}_{1-x}(\text{P/Sb})_x\text{O}_{1-y}(\text{F/H})_y$ ($R = \text{La}$ and Nd). The x -dependence of the lattice constants for $\text{LaFeAs}_{1-x}\text{P}_x\text{O}$ and $\text{NdFeAs}_{1-x}\text{P}_x\text{O}_{0.95}\text{F}_{0.05}$ is also plotted in Figs. S1(a) and (b) for reference. The crystallographic parameters for other samples with different y -values have been shown in Fig. 1 and in our previous report¹.

In all samples of $R\text{FeAs}_{1-x}(\text{P/Sb})_x\text{O}_{1-y}(\text{F/H})_y$, the lattice constants show linear x -dependence, indicating that P or Sb was successfully substituted for As. In addition, the structural parameters have been systematically changed by F- and H-doping. The local structural parameters α and $d_{\text{Fe}-Pn}$ were used when the contour plot of superconducting transition temperature T_c was generated in Fig. 6.

Temperature Dependence of Resistivity

Figures S2 and S3 present the temperature (T -) dependence of resistivity for $\text{NdFeAs}_{1-x}\text{P}_x\text{O}_{1-y}(\text{F/H})_y$ and $\text{LaFeAs}_{1-x}\text{Sb}_x\text{O}_{1-y}(\text{F/H})_y$, respectively. The values of T_c were determined from T for zero resistivity. The power n in $\rho(T) = \rho_0 + AT^n$ was estimated by fitting $\rho(T)$. These T_c and n values were shown in Figs. 4, 5 and 6. The T -dependent resistivities for other compositions were shown in Fig. 2 and our previous reports¹⁻³.
