Supplementary Table 2: Results of no-enzyme control reactions. No-enzyme control reactions were conducted with the hemimethylated and hemihydroxymethylated CpG substrates. In each case, readout of C was expected in the upper DNA strand after bisulfite conversion and readout of T in the lower DNA strand. The data confirm low rates of "overconversion" leading to T readout in the upper strand (0.3 %) and low rates of incomplete conversion leading to C readout in the lower strand (1-2 %).

Supplementary Figures

Supplementary Figure 1: Terminology and principles of the Deep Enzymology approach. a Terminology used in this document to describe the DNA substrate. The target sites of the TET enzymes include CpG and non-CpG sites. Target residues for oxidation are either 5mC or 5hmC. **b** Principle workflow of the Deep Enzymology approach ¹. Second strand synthesis using synthetic oligonucleotides with mCpG site in random N₁₀ flank context as template (step 1). Oxidation of the pool of sequences by TET enzymes (step 2). Hairpin ligation (step 3) and bisulfite conversion (step 4). Generation of sequencing libraries by addition of barcodes and indices (Step 5), and Illumina sequencing (step 6). Extraction of original sequences and cytosine oxidation state followed by downstream analysis (step 7). **c** Principle of the detection of 5-methylcytosine oxidation by bisulfite conversion. The scheme indicates the different oxidation states of 5-methylcytosine and its readout after bisulfite conversion illustrating that the transition of 5hmC to 5fC is detected by this technology.

Supplementary Figure 2: Compilation of the correlation of mCG oxidation flank preferences. a Correlation of NNmCGNN flank preferences observed in the individual experimental repeats with TET1, TET2 V1 and TET2 V2. **b** Heatmap of the averaged oxidation activities of TET1, TET2 V1 and TET2 V2 at NNmCGNN sites sorted by the average activity. The heatmap scale is between zero and the relative maximum of each sample. **c** Correlation of the averaged NNmCGNN flank preferences of TET1, TET2 V1 and TET2 V2. In panels a and c, Pearson correlation factors are shown. Note, the very high similarity of TET2 V1 and TET2 V2.

Supplementary Figure 3: Compilation of the correlation of hmCG oxidation flank preferences. a Correlation of NNhmCGNN flank preferences observed in the individual experimental repeats with TET1, TET2 V1 and TET2 V2. **b** Heatmap of the averaged oxidation activities of TET1, TET2 V1 and TET2 V2 at NNhmCGNN sites sorted by the average activity. The heatmap scale is between zero and the relative maximum of each sample. **c** Correlation of the averaged NNmCGNN (taken from Supplementary Figure 2) and NNhmCGNN flank preferences of TET1, TET2 V1 and TET2 V2. In a and c Pearson correlation factors are shown. Note, the very high similarity of TET2 V1 and TET2 V2.

Supplementary Figure 4: Determination of reaction rates for oxidation of 5mC and 5hmC in NNCGNN context. The figures show examples of the primary data and fit curves.

Supplementary Figure 5: Correlation of the flanking sequence preferences of TET1, TET2, DNMT1, DNMT3A and DNMT3B. Pearson correlation factors of the TET1 and TET2 5mCG oxidation NNCGNN flanking sequence preferences determined here with previously published CpG methylation preferences of DNMT1² and DNMT3A and DNMT3B³.

	TET1	TET2	DNMT1	DNMT3A	DNMT3B
TET1	1.00	0.84	0.26	0.10	0.32
TET2	0.84	1.00	0.17	0.04	0.33
DNMT1	0.26	0.17	1.00	0.06	-0.05
DNMT3A	0.10	0.04	0.06	1.00	0.36
DNMT3B	0.32	0.33	-0.05	0.36	1.00

Supplementary Figure 6: Additional data regarding the LC-MS TET activity assays. a Characteristic ion transitions used in this work. **b** Examples of calibration curves determined for 5mdC, 5hmdC, 5fdC and 5cadC. **c** Examples of LC profiles of standard peaks and peaks obtained from TET oxidation reactions.

Supplementary Figure 7: Fitting of kinetic data requires a processive reaction step. Two examples of fits of reaction progress curves (here for TET1 reacting with the preferred substrate) are shown, which either include a processive step that directly converts 5mC to 5fC and is described by the k_{12} rate constant or not include this step. Note the much worse fit in the right panel. "Exp" refers to the experimental data, "Fit" to the curves showing the best possible fit of the data to the corresponding model.

Supplementary Figure 8: Compilation of the correlation of mCpX oxidation flank preferences. Correlation of mCpX -4 to +4 flanking sequence preferences observed in the individual experimental repeats with TET1, TET2 V1 and TET2 V2. The figures show Pearson correlation factors.
