## Supplementary information

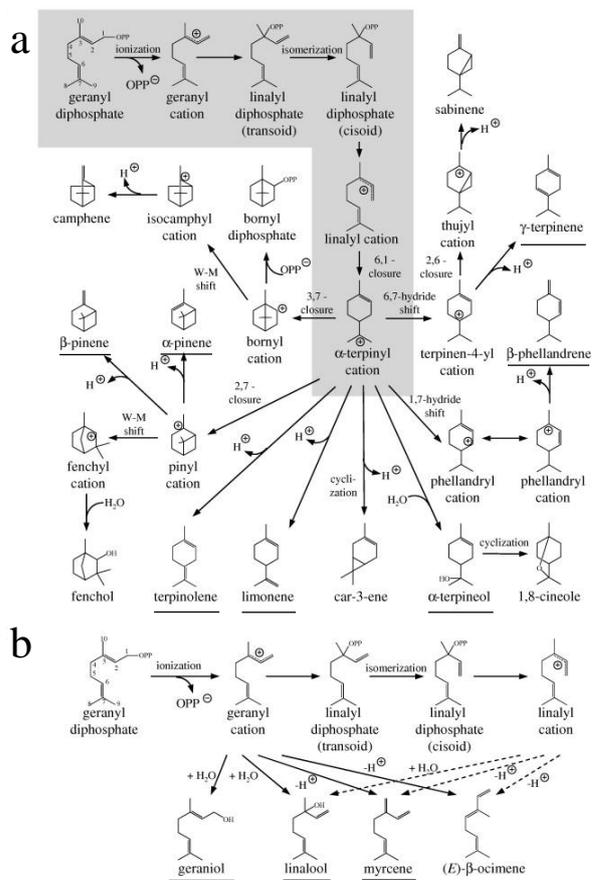

### Figures

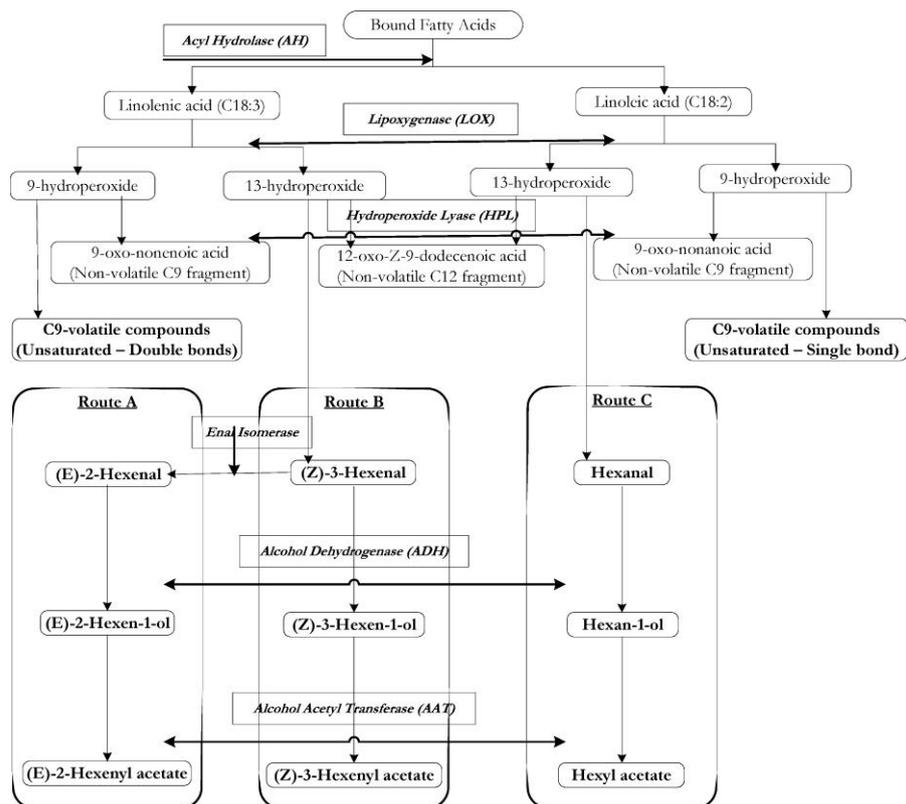

**Figure S1. Aromatic fingerprints of table grapes.** Green line with triangle indicated the fingerprints of pulp juice; yellow line with dot indicated the fingerprints of skin; wine red line with square indicated the fingerprints of whole berries. Scale range of nine cultivars (Jumeigui, Shine Muscat, Red Alexandria, Yoho, Jingya, Black Beet, High Bailey, Tamina, Centennial Seedless) was 0-400; the others was 0-200.

**Figure S2. Part pedigree chart of Kyoho grapevine series (Kyoho or its offspring).** The eight cultivars (A, B, H, J, L, M, O, P) in this study were underlined. Cross indicated cross breeding; circle indicated seeding selection.

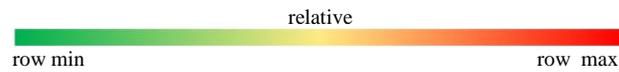

**Figure S3. Synthesis mechanisms of monoterpenes in grapes obtained from the previous report<sup>25</sup>.** (a) indicated synthetic pathway of cyclic monoterpenes; (b) indicated synthetic pathway of acyclic monoterpenes. The mainly compounds in this study are underlined, including cyclics ( $\alpha$ -pinene,  $\beta$ -pinene, phellandrene, limonene,  $\gamma$ -terpinene,  $\alpha$ -terpineol, terpinolene) and acyclics (linalool,  $\beta$ -myrcene, geraniol).

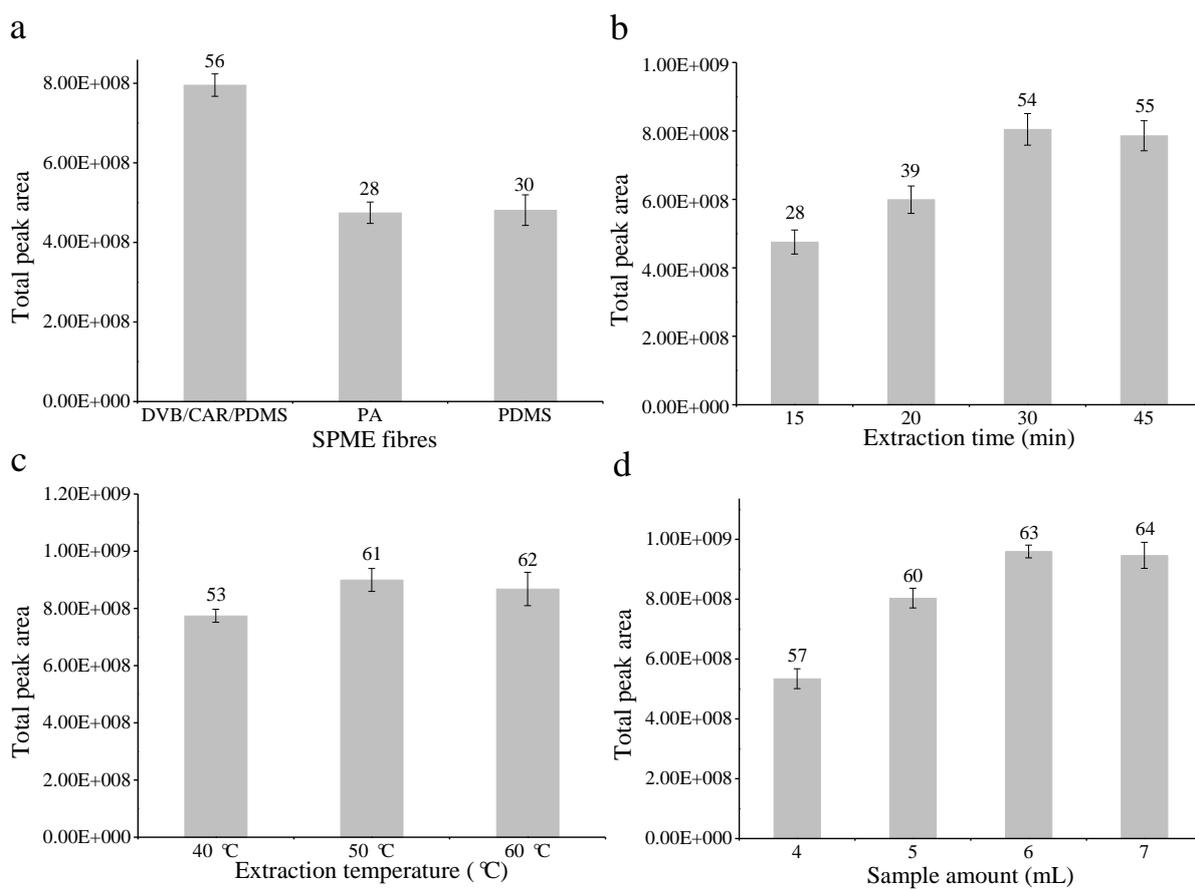

**Figure S4. Metabolic pathway of C<sub>6</sub> compounds in grapes obtained from the previous report<sup>11,20</sup>.** Route A, B, C indicated the different metabolic pathways, respectively.

**Figure S5. The relationship between aromatic series values (whole berries) and aroma preference intensity scores (scale: 1-5) obtained from sensory evaluation analysis.** Data were means (n=3). Ten aromatic series were shown across the top and the colour scale was shown at the bottom. The higher values for each aromatic series were presented in red; otherwise, green was used; white represents the value less than 1. Capital letters (right) referred to the table grape cultivars listed in Figure 1, and their aroma preference scores (left) were shown.

**Figure S6. The optimization of headspace solid phase microextraction (HS-SPME) method.** Performance characteristics obtained for tested solid phase microextraction (SPME) fibres (a) during 40 min at 40 °C, extraction time (b) using divinylbenzene/carboxen/polydimethylsiloxane (DVB/CAR/PDMS) fibre at 40 °C, extraction temperature (c) using DVB/CAR/PDMS fibre during 30 min and volume/headspace volume ratio (d) using DVB/CAR/PDMS fibre during 30 min at 50 °C on total aroma peak area in this work. Number indicated the number of kinds of identified compounds. The best results were obtained using 6 mL of sample (pulp juice or skin extraction solutions) in a 20 mL glass vial with addition of 1.5 g of sodium chloride (NaCl) ( $1/\beta = 0.5$ ), and after equilibrating, a DVB/CAR/PDMS (50/30  $\mu\text{m}$ ) fibre was selected for extraction at 50 °C for 30 min under agitation. Note: in Figure S6 (a), DVB/CAR/PDMS, PA, PDMS indicated divinylbenzene/carboxen/polydimethylsiloxane (50/30  $\mu\text{m}$ ), polyacrylate (85  $\mu\text{m}$ ), polydimethylsiloxane (100  $\mu\text{m}$ ) fiber, respectively.

**Table S2. Concentrations ( $\mu\text{g}/\text{kg}$ ) of monoterpenes determined in skin of table grapes.** Data are shown as the means ( $n=3$ ). %<sup>a</sup>indicated that percentage of monoterpenes contents account for the total terpenes contents. - indicated that the compound was not detected. Capital letters refer to the table grape cultivars listed in Figure 1.

**Table S4. Concentrations ( $\mu\text{g}/\text{kg}$ ) of volatile compounds from different synthesis pathwaysd determined in skin of table grapes.** Data are shown as the means (n=3). - indicated that the compound was not detected. Capital letters refer to the table grape cultivars listed in Figure 1.
