

# Investigating the effects of cooperative vehicles on highway traffic flow homogenization: analytical and simulation studies

Julien Monteil

PHD DISSERTATION DEFENSE

January 28, 2014

## Examining committee:

Hesham RAKHA	Professor, Virginia Tech
Masao KUWAHARA	Professor, Tohoku University
Philippe GOUGEON	Project Manager, Valeo
Salima HASSAS	Professor, Université de Lyon
Jacques SAU	Professor, Université de Lyon
Nour-Eddin EL FAOUZI	PhD supervisor, IFSTTAR

## Cooperative vehicles = connected + autonomous vehicles ?

- ▶ V2X communication channels (4G, WIFI...)
- ▶ In-vehicle sensors (embedded cameras, radars...)

Investigating the effects of cooperative vehicles on highway traffic flow

Multi-agent modelling framework

Conclusions and perspectives

## Cooperative vehicles = connected + autonomous vehicles ?

- ▶ V2X communication channels (4G, WIFI...)
- ▶ In-vehicle sensors (embedded cameras, radars...)

## Future of traffic flow ?

- ▶ Transition of a mixed traffic...
- ▶ Cooperative vehicles should relieve the driving task and adapt to **safe** drivers' behavior

Real data-based simulation

Methodology for calibration

First simulation results

Multi-agent modelling framework

Conclusions and perspectives

**Future situation** : a mixed fleet made of cooperative vehicles and non-cooperative vehicles (normal drivers) on highways, with the goal to increase traffic flow safety.

1. What physics to explain the formation of stop and go waves ?
2. What information/data is relevant to exchange between cooperative vehicles ?
3. How to use this information, how should cooperative vehicles behave ?
4. How to deal with communication noises ?
5. Is a mixed traffic made of cooperative and « normal » vehicles safer ?

Multi-agent modelling framework

Conclusions and perspectives

## Time discrete models

- ▶ Stimulus-response models : Pipes GM-1 (1953), Greenberg GM-3 (1959), Van Aerde (1995), RPA (2009) models

### GM-1 :

$$\ddot{x}_n(t + \tau) = \alpha \cdot [\dot{x}_{n+1}(t) - \dot{x}_n(t)]$$

- ▶ Other types : Gipps (1976), Newell (1961, 2002)

### Simplified Newell (2002) :

$$x_n(t + \tau) = x_{n+1}(t) - d$$

## Time continuous models

- ▶ General form :

$$\begin{aligned}\dot{x}_n &= \frac{dx_n}{dt} \\ \ddot{x}_n &= f(\dot{x}_n, \Delta x_n, \Delta \dot{x}_n)\end{aligned}$$

Investigating the effects of cooperative vehicles on highway traffic flow

Conclusions and perspectives

## Time continuous models

- ▶ General form :

$$\begin{aligned}\dot{x}_n &= \frac{dx_n}{dt} \\ \ddot{x}_n &= f(\dot{x}_n, \Delta x_n, \Delta \dot{x}_n)\end{aligned}$$

- ▶ Examples : OVM (Bando *et al.*, 1995), OVRV model (Jiang *et al.*, 2001), IDM (Treiber *et al.*, 2000), IOVM (Treiber and Kesting, 2013)

**OVRV :**

$$f(\dot{x}_n, \Delta x_n, \Delta \dot{x}_n) = -\frac{1}{\tau} \dot{x}_n + \frac{1}{\tau} V(\Delta x_n) + \eta \Delta \dot{x}_n$$

13 Traffic modelling and cooperation

Stability analyses

State of the art

Stability analyses of cooperative car-following models

Real data-based simulation

Methodology for calibration

First simulation results

Multi-agent modelling framework

Conclusions and perspectives

## ACC model : Kesting *et al.* (2010)

- ▶ IDM+CAH model for lane changing maneuvers
- ▶ Implemented on motorways

## Multi-anticipation framework : Ge *et al.* (2006), Hoogendoorn *et al.* (2006), Treiber *et al.* (2006)

- ▶ Physical behavior
- ▶ CACC framework

## ACC model : Kesting *et al.* (2010)

- ▶ IDM+CAH model for lane changing maneuvers
- ▶ Implemented on motorways

## Multi-anticipation framework : Ge *et al.* (2006), Hoogendoorn *et al.* (2006), Treiber *et al.* (2006)

- ▶ Physical behavior
- ▶ CACC framework

## Flocking framework : Reynolds (1987), Olfati-Saber (2006)

- ▶ Behaviors of groups of particles in 3D
- ▶ Algorithms for speed homogenization and collision avoidance

# Modelling choice for future developments

Investigating the effects of cooperative vehicles on highway traffic flow

Julien Monteil

## Time continuous models

$$\ddot{x}_n = f(\dot{x}_n, \Delta x_n, \Delta \dot{x}_n)$$

14

# Stability criteria of traffic flow

## Linear vs non-linear stability : Treiber and Kesting (2013)

**Usual approach :**  $\Delta y_n(t) = Y_0 e^{i(kn+zt)}$ ,  $z = -i\omega$ ,  $k \in [0, \pi]$

- ▶ Derivation of analytical conditions for linear string (small perturbations) and local stability
- ▶ In traffic, only convective instabilities are observed
- ▶ Forward multi-anticipation increases stability

# Stability analyses

## Presentation of the cooperative car-following model

$$\ddot{x}_n = f_c(\dot{x}_n, \sum_{j=-m_b}^{m_f} a_j \Delta x_{n+j}, \sum_{j=-m_b}^{m_f} a_j \Delta \dot{x}_{n+j})$$

Continuous relation : 
$$\sum_{j=-m_b}^{m_f} a_j = \sum_j a_j = 1$$

$$f_c = f_{\text{IDM/OVRM/IOVM}} - c_1(\dot{x}_n - \dot{x}_d) + c_2\left(\sum_j a_j \Delta x_{n+j} - \Delta x_d\right)$$

Context and motivations

Traffic modelling and cooperation

Stability analyses

State of the art

18 Stability analyses of cooperative car-following models

Real data-based simulation

Methodology for calibration

First simulation results

Multi-agent modelling framework

Conclusions and perspectives

**First order development :**  $\Delta \ddot{y}_n = f_1 \Delta \dot{y}_n +$   
 $f_2 \sum_j a_j (\Delta y_{n+j+1} - \Delta y_{n+j}) + f_3 \sum_j a_j (\Delta \dot{y}_{n+j+1} - \Delta \dot{y}_{n+j}),$   
with  $f_1 = \partial f / \partial \dot{x}(\dot{x}_{eq}, \Delta x_{eq}, 0), \dots$

**Dispersion relation :**  $z^2 - z (f_1 + f_3 (e^{ik} - 1)) - f_2 (e^{ik} - 1) = 0$

Julien Monteil

Context and motivations

Traffic modelling and cooperation

Stability analyses

State of the art

19 Stability analyses of cooperative car-following models

Real data-based simulation

Methodology for calibration

First simulation results

Multi-agent modelling framework

Conclusions and perspectives

**First order development :**  $\Delta \ddot{y}_n = f_1 \Delta \dot{y}_n + f_2 \sum_j a_j (\Delta y_{n+j+1} - \Delta y_{n+j}) + f_3 \sum_j a_j (\Delta \dot{y}_{n+j+1} - \Delta \dot{y}_{n+j})$ ,  
with  $f_1 = \partial f / \partial \dot{x}(\dot{x}_{eq}, \Delta x_{eq}, 0), \dots$

**Dispersion relation :**  $z^2 - z (f_1 + f_3 (e^{ik} - 1)) - f_2 (e^{ik} - 1) = 0$

Let us remind  $\Delta y_n(t) = Y_0 e^{i(kn+zt)}$ . Growing perturbations are of the long wavelength type.

**Result :** without cooperation ( $a_0 = 1, a_{j \neq 0} = 0$ ),  $k_z = \arccos\left(\frac{f_1^2 + 2f_3^2 - 3f_1 f_3 - f_2}{f_2 + 2f_3^2 - f_3 f_1}\right)$

# Linear stability analyses

Contributions 2/3

## Analytical results at long wavelengths

1. Bilateral traffic brings stability
2. Linear control term  $c_1$  brings stability

First simulation results

Multi-agent modelling framework

Conclusions and perspectives

Time continuous CF (cooperative or not) have a **Korteweg de Vries** (Korteweg and de Vries, 1895 ; Nagatani, 2001) development for the perturbation growth.

Series of mathematical developments to get :

- ▶ the general expression of the KdV equation near the string stability surface for cooperative and non-cooperative traffic :  
$$C_1 \partial_X^3 R + C_2 R \partial_X R + C_3 \partial_T R = 0,$$
- ▶ a condition over the sign of the shock wave (same sign as  $C_2$ ),
- ▶ the amplitude of the shock wave.

$$\Delta y_n(t) = \text{sgn}(C_2) \mathbf{A} \operatorname{sech}^2 \left[ \sqrt{\frac{|C_2| \mathbf{A}}{12 C_1}} (n - \alpha_s t) \right]$$

### Methods for correlation analyses

- ▶ The normality hypothesis does not stand for all parameters marginal distributions (based on the Shapiro-Wilk test)
- ▶ The Pearson test should be completed by the Kendall and Spearman methods, which account for the discordance and concordance values
- ▶ Principal Component analysis for linear correlation between parameters
- ▶ Observed correlations oppose reactive to passive driving styles

Conclusions and perspectives

### Methods for correlation analyses

- ▶ The normality hypothesis does not stand for all parameters marginal distributions (based on the Shapiro-Wilk test)
- ▶ The Pearson test should be completed by the Kendall and Spearman methods, which account for the discordance and concordance values
- ▶ Principal Component analysis for linear correlation between parameters
- ▶ Observed correlations oppose reactive to passive driving styles

### Objectives to understand the correlation between parameters in order to

- ▶ Estimate joint distributions while preserving the correlation structure
- ▶ Sample a realistic traffic from the estimated joint distributions

### Simulation choices

- ▶ IDM parameters sampled from random sampling with correlation (« mean » traffic **linearly unstable**)
- ▶ Lane-changing model : MOBIL model (Treiber and Kesting, 2009)
- ▶ Numerical scheme : mixed first order second order Euler scheme
- ▶ Cooperative law : cosine window, bilateral law with tuned linear control terms

## Why multi-agent systems ?

- ▶ Partial and noisy perception of the environment
- ▶ Flexibility of interactions
- ▶ Idea of **self-organization**

## Multi-agent structure with trust layer (Nguyen Vu *et al.*, 2012)

- ▶ Physical layer → car-following rules
- ▶ Communication layer → proximity and reliability rules
- ▶ Trust layer → sensors network

# Multi-agent framework

## Definition

## Physical layer

- ▶ Cooperative IDM model
- ▶ Limited interaction range ( $r = 4 \cdot \Delta x_{eq}$ ) : avoid scaling effects for low coverage
- ▶ Limited number of information data points ( $m = 2$   $m' = 2$ ) : avoid loss of reactivity to the leader trajectory

40 Multi-agent modelling framework

Conclusions and perspectives

## Communication layer

1. Cooperative coefficients as a multiplication (proximity $\times$ trust) rule

$$a_{ij} = \frac{p_{ij} \cdot T_{ij}}{\sum_l p_{il} T_{il}}$$

2. Required decreasing coefficients with distance
3. Required minimum trust in the relative information to the leader
4. Multiplication of control gains by self-trust

Conclusions and perspectives

### Communication layer

1. Cooperative coefficients as a multiplication (proximity $\times$ trust) rule

$$a_{ij} = \frac{p_{ij} \cdot T_{ij}}{\sum_l p_{il} T_{il}}$$

2. Required decreasing coefficients with distance
3. Required minimum trust in the relative information to the leader
4. Multiplication of control gains by self-trust

### Trust layer

1. Relation between error measurements and **direct trust**

$$DT_{ij} = \max(1 - m_{ij}\sigma, 0)$$

2. Computation of an **indirect trust**
3. Update rule for the trust

$$T_{ij} = \frac{T_{ii}DT_{ij} + IT_{ij}}{T_{ii} + 1}$$

4. Update rule for the self-trust
