

TRAUMA.SOFT

BedViewer

BedViewer is a component of Traumasoft's platform – an integrated software system for EMS providers that holistically manages data from CAD, Billing, ePCR and more.

As part of Traumasoft's Business Development Suite, BedViewer gives EMS providers a competitive edge with their care facility prospects and customers. It's available for your care facilities to view, manage, and allocate bed usage.

Likewise, EMS dispatchers can see upcoming facility discharges and plan accordingly, from reserving a bed for an incoming patient through to a macro view of bed usage trends across multiple facilities.

Data tracking and bed management

Patients

BedViewer allows your customers to secure space and reserve beds for incoming patients specifically while providing overall capacity information overview and information.

Bed Traffic

Realtime bed traffic can be monitored, imminent discharges can be accurately forecasted, and time allowed to plan for those discharges. Traumasoft's BedViewer allows your care facilities to customize their bed and patient types with flags and notifications.

The fluid, ever-changing nature of bed usage can be monitored easily. Likewise, patient and bed-pairing can be accomplished easily so facility staff can focus on patient care.

Link patient data to bed allocation

Patient data is linked within BedViewer so users can see critical patient care information, insurance details and payment details. Custom flags can be set to allow for quick and easy recognition of vital information.

A patient's "code status," the names and numbers of important contacts, demographics, and insurers can be located on an organized and easy-to-read page. By linking patient information to beds, care needs and records management is greatly enhanced.

Use cases

For Departments

Managing a department's (or unit's) bed traffic requires an overarching view of capacity and patient flow.

Traumasoft's BedViewer provides an overview of bed utilization across floors and departments at a glance. Bed status is visible in real-time and allows for allocation and planning in the simplest manner.

For Hospitals

For multi-facility management, BedViewer gives care providers a birds-eye view of bed usage capacity at any point in time. Compare usage across locations and configure bed types within departments to see how patient stays and patient data can build insights for your business.

At Traumasoft, we offer a recognized, leading-edge solution for EMS providers that accelerates billing, simplifies trips and manages people operations. We're excited to share our BedViewer capability with you.

TRAUMA.SOFT

[REQUEST A DEMO TODAY](#)

Born from the real-world needs of providers, Traumasoft is an EMS performance technology company. Traumasoft was developed from the ground up, providing organizations with one integrated solution to elevate their entire operation. We exist in the community and draw on the wisdom of the industry to continually develop and deliver automated, smart software for the future of EMS Operations.
