

Practical advice for arXivers

If you want to submit one of your publications to arXiv, please note the following.

Consider which journals you will submit your article to first. Some journals do not allow publication of preprints on repositories. The SHERPA/RoMEO list includes informal guidelines on the policies of individual publishers (<http://www.sherpa.ac.uk/romeo>).

However, your publishing contract or the publisher's self-archiving policy is legally binding. If you are uncertain whether and under what license a publisher allows simultaneous publication in a repository, please contact the University Library (ub-open-access@fau.de).

1. Use a university e-mail address with your first submission. Otherwise an endorsement may be required from an active arXiv author as proof of suitability.
2. The arXiv accepts TeX, LaTeX, pdfLaTeX, PDF, PostScript and html file formats.
3. It is usual to wait for a few days after publishing the article on arXiv before submission to a peer-reviewed journal. This makes it possible to take account of feedback from other scientists directly in the journal version.
4. It makes sense to publish a corrected version to the arXiv server after the peer review process. Many publishers allow this, as long as the document is created by the authors (see publishing contract, policy or SHERPA/RoMEO list).
5. For additional local visibility and long-term archiving at FAU you should also submit the publication to the OPUS FAU repository and CRIS (Current Research Information System).

arXiv Overlay Journals

arXiv overlay journals (AOJ) are a special kind of journal, which build on the arXiv infrastructure. All articles are compiled directly via arXiv, requiring only a minimum of server resources and technical services. The final journal version is also stored in arXiv after passing through the full peer review process which ensures content quality. The journal only manages links and metadata (for example keywords and abstracts) to the articles in arXiv. Proofreading and typesetting are not usually provided as authors are responsible for spelling and layout.

AOJ are open access and have very low running costs thanks to the processes described above. For the new AOJ Discrete Analysis, the cost is estimated at about 10 euros per publication. Since it is not possible to change a version of an article stored in the arXiv, the AOJ authentication link is generally sufficient.

What is arXiv?

arXiv (<http://arxiv.org>) was created in 1991 as an online repository for providing preprint papers, primarily for high-energy physics. It is now one of the world's largest open-access repositories for full-text articles with over one million articles. Most of the around 300 daily publications come from the fields of physics, mathematics and computer science – the latter being the fastest growing areas. arXiv is also used by quantitative biology and finance. For biosciences and life sciences, bioRxiv is more specialized (<http://biorxiv.org>).

arXiv has the aim of collecting material that is of interest, relevance and value to its subjects. All articles are therefore moderated by experts in their fields. Inappropriate content, obvious plagiarism and copyright infringement is filtered out during this process.

arXiv.org

More than a repository

Primarily, arXiv is a publication server for green open-access publications. Beyond storing documents arXiv also functions as a new publications service. With RSS feeds, email alerts and new submissions lists, arXiv has long been a platform for making publications visible immediately to an appropriate audience. For many areas, such as high energy physics, articles that are also published in arXiv receive five times as many citations as those which are not.

arXiv also allows supplements to be added to each article. This can include data records, application examples or program code. As each article is stored in the arXiv history, it is possible to add new versions of existing articles without losing the older versions. This allows lecture notes to be updated or unabridged versions of publications that have been shortened by the publisher to be added.

arXiv at FAU

Members of FAU download more than 30,000 documents from arXiv annually. This corresponds to place 139 among universities worldwide. Almost 30 articles are posted by members of FAU on arXiv each month. The FAU supports arXiv through a German consortium, which is coordinated by the Technical Information Library (TIB) in Hanover, the Helmholtz Association and the Max Planck Society.

Preprint papers which were published in arXiv can also be uploaded to the online publication system OPUS FAU to ensure local visibility and long-term archiving.

Benefits of publication in arXiv

Storing articles in arXiv provides all the benefits of open access:

- » Free access to academic information
- » Good visibility through search engines and citation services by indexing the full text
- » All the advantages of digital publishing (no space constraints and integration of other content)
- » Promotion of research efficiency through prompt discussion of research results

Storing publications in arXiv also has the following benefits:

- » Large sections of the research community can be notified automatically and promptly (alerts, RSS feeds, information services) about new submissions.
- » Lectures or proceedings which are not planned for publication in journals can be accessed via the arXiv ID.
- » Automatic version control ensures that citations remain correct even after the article is updated.
- » The service is free of charge for authors and readers.
- » The authors retain exclusive exploitation rights and the legal situation is simplified by Creative Commons licenses.

Legal aspects

arXiv provides four Creative Commons licenses: CC 0, CC BY, CC BY-SA and CC BY-NC-SA. Additional information on these licenses can be found at <http://de.creativecommons.org/was-ist-cc/>. Bear in mind that the chosen license must not interfere with subsequent publishing licenses or contracts.
