# Overview of this manual

#### **About this manual**

This manual explains the basics of how and when to use the RobotWare option *Robot Reference Interface*.

#### Usage

This manual can be used either as a reference to find out if an option is the right choice for solving a problem, or as a description of how to use an option. Detailed information regarding syntax for RAPID routines and configuration of system parameters is not described here, but can be found in the respective reference manual.

#### Who should read this manual?

This manual is mainly intended for robot programmers.

#### **Prerequisites**

The reader should be:

- · Familiar with industrial robots and their terminology.
- Familiar with the RAPID programming language.
- Familiar with RobotStudio and how to work with system parameters.

#### References

Reference	Document ID
Operating manual - General safety information	3HAC031045-001
Technical reference manual - RAPID Instructions, Functions and Data types	3HAC16581-1
Operating manual - RobotStudio	3HAC032104-001
Sample code available on www.abb.com/robotics (ABB Library)	

#### Revisions

Revision	Description
-	First edition
A	Released with RobotWare 5.12. Minor corrections. SiConnect has a new switch \NoStop. Updates in sensor. SiTool and SiWobj are no longer needed for calculations. Current tool and workobject are used instead.
В	Released with RobotWare 5.14.  The following updates are made:  • The correct unit for robot joints is radians, see Example configuration on page 28.  • Corrected code in examples, see Example configuration on page 28.
С	Correction of connections in Connecting the communication cable on page 15.

# Continued

Revision	Description		
D	Released with RobotWare 5.15. Clarifications added regarding the direction of data exchange in <i>Introduction to Robot Reference Interface on page 13</i> .		
E	<ul> <li>Released with RobotWare 5.15.01.</li> <li>All references to the protocol high-priority UDP (HP-UDP) are removed throughout the manual. The protocol is not supported.</li> <li>The attribute Link is changed from optional to mandatory in <i>Properties on page 26</i>.</li> <li>Minor corrections.</li> </ul>		
F	Released with RobotWare 5.60.  Updated the graphic in the section Connecting the communication cable on page 15.  Updated information related to Network ports in the section Device description on page 21.		

# **Product documentation, IRC5**

#### Categories for manipulator documentation

The manipulator documentation is divided into a number of categories. This listing is based on the type of information in the documents, regardless of whether the products are standard or optional.

All documents listed can be ordered from ABB on a DVD. The documents listed are valid for IRC5 manipulator systems.

#### **Product manuals**

Manipulators, controllers, DressPack/SpotPack, and most other hardware will be delivered with a **Product manual** that generally contains:

- Safety information.
- Installation and commissioning (descriptions of mechanical installation or electrical connections).
- Maintenance (descriptions of all required preventive maintenance procedures including intervals and expected life time of parts).
- Repair (descriptions of all recommended repair procedures including spare parts).
- · Calibration.
- · Decommissioning.
- Reference information (safety standards, unit conversions, screw joints, lists of tools).
- Spare parts list with exploded views (or references to separate spare parts lists).
- Circuit diagrams (or references to circuit diagrams).

#### **Technical reference manuals**

The technical reference manuals describe reference information for robotics products.

- Technical reference manual Lubrication in gearboxes: Description of types and volumes of lubrication for the manipulator gearboxes.
- Technical reference manual RAPID overview: An overview of the RAPID programming language.
- Technical reference manual RAPID Instructions, Functions and Data types: Description and syntax for all RAPID instructions, functions, and data types.
- *Technical reference manual RAPID kernel*: A formal description of the RAPID programming language.
- Technical reference manual System parameters: Description of system parameters and configuration workflows.

#### **Application manuals**

Specific applications (for example software or hardware options) are described in **Application manuals**. An application manual can describe one or several applications.

#### Continued

An application manual generally contains information about:

- The purpose of the application (what it does and when it is useful).
- What is included (for example cables, I/O boards, RAPID instructions, system parameters, DVD with PC software).
- · How to install included or required hardware.
- · How to use the application.
- · Examples of how to use the application.

### **Operating manuals**

The operating manuals describe hands-on handling of the products. The manuals are aimed at those having first-hand operational contact with the product, that is production cell operators, programmers, and trouble shooters.

The group of manuals includes (among others):

- · Operating manual Emergency safety information
- · Operating manual General safety information
- Operating manual Getting started, IRC5 and RobotStudio
- · Operating manual Introduction to RAPID
- · Operating manual IRC5 with FlexPendant
- Operating manual RobotStudio
- Operating manual Trouble shooting IRC5, for the controller and manipulator.

# Safety

## Safety of personnel

A robot is heavy and extremely powerful regardless of its speed. A pause or long stop in movement can be followed by a fast hazardous movement. Even if a pattern of movement is predicted, a change in operation can be triggered by an external signal resulting in an unexpected movement.

Therefore, it is important that all safety regulations are followed when entering safeguarded space.

#### Safety regulations

Before beginning work with the robot, make sure you are familiar with the safety regulations described in the manual *Operating manual - General safety information*.

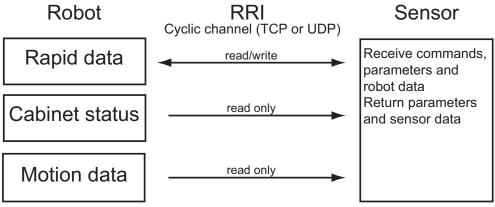

# 1 Introduction to Robot Reference Interface

#### Introduction

Robot Reference Interface is an option, supporting data exchange on the cyclic channel. It provides the possibility to periodically send planned and actual robot position data from the robot controller, as well as the exchange of other RAPID variables from and to the robot controller. The message contents are represented in XML format and are configured using appropriate sensor configuration files.

#### **Robot Reference Interface**

The cyclic communication channel (TCP or UDP) can be executed in the high-priority network environment of the IRC5 Controller which ensures a stable data exchange up to 250Hz.

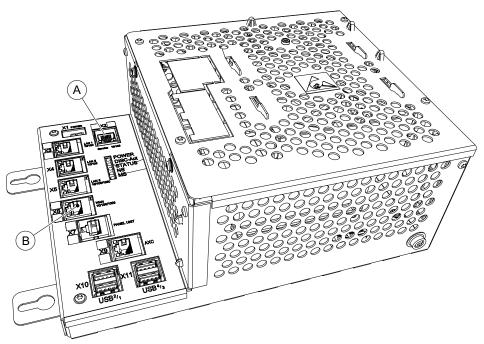

# 2 Installation

# 2.1 Connecting the communication cable

#### Overview

This section describes where to connect the communication cable on the controller. For further instructions, see the corresponding product manual for your robot system.

#### Location

xx1300000609

Α	Service port on the computer unit (connected to the service port on the controller)
В	WAN port on the computer unit

	Action	Note	
1	Use one of these two connections (A or B).	Note	
		The service connection can only be used if it is free.	

#### 2.2 Prerequisites

# 2.2 Prerequisites

#### Overview

This section describes the prerequisites for using Robot Reference Interface.

#### **UDP/IP or TCP IP**

Robot Reference Interface supports the communication over the standard IP protocols UDP or TCP.

#### Recommendations

The delay in the overall communication mostly depends on the topology of the employed network. In a switched network the transmission will be delayed due to buffering of the messages in the switches. In a parallel network collisions with multiple communication partners will lead to messages being resent.

Therefore we recommended using a dedicated Ethernet link between the external system and the robot controller to provide the required performance for real-time applications. *Robot Reference Interface* can be used to communicate with any processor-based devices, that support IP via Ethernet and can serialize data into XML format.

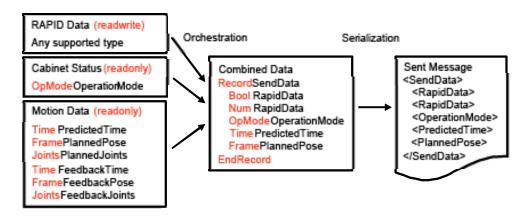

2.3 Data orchestration

#### 2.3 Data orchestration

#### Overview

The outgoing message can be combined from any data from the RAPID level and internal data from the cabinet and motion topic. The orchestration of the data is defined in the device configuration by setting the Link attribute of internally linked data to *Intern*.

#### Illustration

xx0800000178

#### **Data from the Controller topic**

Name	Туре	Description	Comment
OperationMode	OpMode		The mapping of the members for the Op- Mode type can be defined in the configura- tion file.

#### **Data from the Motion topic**

Name	Туре	Description	Comment
FeedbackTime	Time	Time stamp for the robot position from drive feedback.	There is a delay of approximately 8ms.
FeedbackPose	Frame	Robot TCP calculated from drive feedback.	Current tool and workobject are used for calculation.
FeedbackJoints	Joints	Robot joint values gathered from drive feedback.	
PredictedTime	Time	Timestamp for planned robot TCP position and joint values.	Prediction time from approximately 24ms to 60ms depending on robot type.
PlannedPose	Frame	Planned robot TCP.	Current tool and workobject are used for calculation.
PlannedJoints	Joints	Planned robot joint values.	

#### 2.4 Supported data types

# 2.4 Supported data types

#### Overview

This section contains a short description of the *Robot Reference Interface* supported data types, for more detailed information about the supported data types see *References on page 7*.

#### **Data types**

Robot Reference Interface supports the following simple data types:

Data type	Description	RAPID type mapping
bool	Boolean value.	bool
real	Single precision, floating point value.	num
time	Time in seconds expressed as floating point value.	num
string	String with max length of 80 characters.	string
frame	Cartesian position and orientation in Euler Angles (Roll-Pitch-Jaw).	pose
joints	Robot joint values.	robjoint

In addition, user-defined records can also be transferred from the external system to the robot controller, which are composed from the supported simple data types. User defined record types must be specified in the configuration file of the external device. See *Device configuration on page 24* for a description on how to create user-defined record types.

3.1 Interface configuration

# 3 Configuration

# 3.1 Interface configuration

#### **Configuration files**

The configuration and settings files for the interface must be located in the folder HOME/GSI. This ensures that the configuration files are included in system backups.

#### **Related information**

For more detailed information of the *Settings.xml* file see *Interface settings on page 20*.

For more detailed information of the *Description.xml* file see *Device description* on page 21.

For more detailed information of the *Configuration.xml* file see *Device configuration* on page 24.

#### 3.2 Interface settings

# 3.2 Interface settings

#### Overview

This section describes the use of the xml file Settings.xml.

#### Settings.xml

The settings file Settings.xml contains the general settings for the GSI interface. It is located in the folder HOME/GSI. For the option *Robot Reference Interface* this file refers to a list of all communication clients for external systems installed in the controller. The Settings.xml file can be defined according to the XML schema Settings.xsd.

#### Example

For each communication client installed on the controller, the file Settings.xml must contain a Client entry in the Clients section. The Convention attribute identifies the protocol convention used by the client, for the *Robot Reference Interface* option only CDP is supported. The Name attribute identifies the name of the client and also specifies the folder with the device related configuration files.

CDP stands for *cyclic data protocol* and is the internal name of the protocol, on which *Robot Reference Interface* messages are transferred.

An internal client node of the interface module will be created, which is able to connect to the external system *MySensor* that runs a data server application and can communicate via *Robot Reference Interface* with the robot.

For each sensor system, a subdirectory named with the sensor system identifier, for example *MySensor*, contains further settings.

3.3 Device description

### 3.3 Device description

#### Overview

This section describes the use of the xml file *Description.xml*.

#### **Description.xml**

The device description file Description.xml is located in the corresponding subdirectory of the device. It specifies the general device parameters, network connection and CDP specific communication settings for an installed device. A device description can be defined according to the XML schema Description.xsd.

#### Example

This is an example of a device description:

#### Name

The first section defines the general device parameters. The Name element identifies the name of the device and should correspond to the device name specified in the settings file. It must correspond to the identifier specified for the device descriptor on the RAPID level, because the descriptor name will be used initially to refer to the device in the RAPID instructions.

Element	Attribute	Description	Value	Comment
Name		Device identifier	Any string	Maximum 16 characters

#### Convention

The Convention element identifies the protocol that should be used by the device, for the *Robot Reference Interface* option only the Cyclic Data Protocol (CDP) is supported.

Element	Attribute	Description	Value	Comment
Convention		Protocol type	CDP	

#### 3.3 Device description

#### Continued

#### Type and Class

The Type and Class elements identifies the device type and class and are currently not validated, therefore they can also contain undefined device types or classes.

	Element	Attribute	Description	Value	Comment
	Туре		Sensor type	Any string	Not validated
	Class		Sensor class	Any string	Not validated

#### **Network**

The Network section defines the network connection settings for the device. The Address attribute specifies the IP address or host name of the device on the network. The optional Port attribute is used to specify the physical Ethernet port on the controller side that the cable is plugged into. Valid values are *WAN* and *Service*. The attribute can be omitted if the WAN port is used for communication.

Element	Attribute	Description	Value	Comment
Network		Network settings		
	Address	IP address or host name of the device	Any valid IP ad- dress or host name	10.49.65.249 DE-L-0328122
	Port	Physical Ethernet port on the controller	WAN Service	Optional. Can be omitted if WAN port is used.

#### Channel

The Channel element defines the settings for the communication channel between the robot controller and the external device. The Type attribute identifies the channel type, only *Cyclic* is supported by *Robot Reference Interface*.

The Protocol attribute identifies the IP protocol used on the channel, for *Robot Reference Interface* you can specify to use *Tcp* or *Udp*. The Port attribute specifies the logical port number for the channel on the device side.

Element	Attribute	Description	Value	Comment
Channel		Channel settings		
	Туре	Channel type	Cyclic	
	Protocol	The IP protocol type	Tcp Udp	
	Port	The logical port number of the channel	uShort	Any available port number on the device, maximum 65535.

3.3 Device description

Continued

#### Settings

The Settings section contains communication parameters specific to the CDP protocol. The TimeOut element defines the timeout for not received messages. This element identifies the time until the connection is considered broken and is only needed for bidirectional communication. The MaxLost attribute defines the maximum number of not acknowledged or lost messages allowed. The DryRun element identifies, if the acknowledgement of messages is supervised and can be used to setup an unidirectional communication.

Element	Description	Value	Comment
TimeOut	Time out for commu- nication		Time in milliseconds, a multiple of 4 ms.
MaxLost	Maximum loss of packages allowed	Integer	
DryRun	Interface run mode	Bool	If TRUE, TimeOut and MaxLost will not be checked.

If the element DryRun in the Description.xml is set to FALSE, communication supervision is established on the protocol level of the *Robot Reference Interface*, using the settings for *TimeOut* and *MaxLost*. This supervision requires that each message that is sent out from the robot controller is answered by the connected device. The supervision generates a communication error, if the maximum response time or the maximum number of lost packages is exceeded. Each sent out message has an ID, which needs to be used for the ID in the reply too, to identify the reply message and to detect which packages have been lost. See also the example in section *Transmitted XML messages on page 31*.

#### 3.4 Device configuration

# 3.4 Device configuration

#### Overview

The device configuration file *Configuration.xml* is located in the corresponding subdirectory of the device. It defines the enumerated and complex types used by the device and identifies the available parameters, which can be subscribed for cyclic transmission. The configuration file can be defined according to the XML schema Configuration.xsd. The following document shows a simplified device configuration.

#### **Example**

```
<?xml version="1.0" encoding="utf-8"?>
<Configuration>
  <Enums>
    <Enum Name="opmode" Link="Intern">
      <Member Name="ReducedSpeed" Alias="Alias"/>
    </Enum>
  </Enums>
  <Records>
    <Record Name="senddata">
      <Field Name="PlannedPose" Type="Pose" Link="Intern" />
    </Record>
  </Records>
  <Properties>
    <Property Name="DataToSend" Type="senddata" Flag="WriteOnly"</pre>
  </Properties>
</Configuration>
```

#### **Enums**

In the Enums section each Enum element defines an enumerated type. The Name attribute of the Enum element specifies the name of the enumerated type, the optional Link attribute identifies if the members of the enumerated type have internal linkage.

Element	Attribute	Descriptions	Value	Comment
Enum	Name	Name of enumerated type	A valid RAPID symbol name	Maximum 16 characters.
	Link	Linkage of mem- bers of enumer- ated type	Intern	Optional. Can be omitted if members only have RAPID linkage.

3.4 Device configuration

Continued

#### Member

Each Member element defines a member element of the enumerated type. The Name attribute specifies the name of the member on the controller side (on RAPID level). The Alias attribute identifies the name of the member on the device side (and in the transmitted message).

Element	Attribute	Descriptions	Value	Comment
Member	Name	Name of enumerated type member	A valid RAPID symbol name	Maximum 16 characters.Valid internal RAPID symbol names. See <i>Data orchestration on page 17</i> .
	Alias	Alias name of enumerated type member	String	Optional. The alias name is used on the device side and in message

#### Record

In the Records section each Record element defines a declaration of a complex type. In RAPID this complex type will be represented as a RECORD declaration. The Name attribute identifies the name of the complex type on the controller side. The Alias attribute defines the alias name of the type on the device side and in the message.

Element	Attribute	Descriptions	Value	Comment
Record	Name	Name of the complex type.	A valid RAPID symbol name	Maximum 16 characters.
	Alias	Alias name of complex type.	String	Optional. The alias name is used on the device side and in message.

#### Field

Each Field element defines a field element of a complex type. The Name attribute identifies the name of the field. The Type attribute identifies the enumerated, complex or simple type associated with the field. The Size attribute defines the size of a multi-dimensional field. The Link attribute identifies if the field has internal linkage.

Element	Attribute	Descriptions	Value	Comment
Field	Name	Name of the complex type field	A valid RAPID symbol name	Maximum 16 characters.Valid internal RAPID symbol names. See <i>Data orchestration on page 17</i> .
	Туре	Data type of the field	All supported data types	Described in section Supported data types on page 18.
	Size	Dimensions of the field (size of array)	Integer	Optional. Only basic types can be defined as array.
	Link	Linkage of com- plex type field	Intern	Optional. Can be omitted if field has RAPID linkage.
	Alias	Alias name of complex type field	String	Optional. The alias name is used on device side and in message.

# 3.4 Device configuration

#### Continued

# **Properties**

In the Properties section each Property element defines a RAPID variable that can be used in the SiGetCyclic and SiSetCyclic instructions.

Element	Attribute	Descriptions	Value	Comment
Property	Name	Name of the property	An valid RAPID symbol name	Maximum 16 characters.
	Туре	Data type of the property	All supported data types	Described in section Supported data types on page 18.
	Size	Dimension (Size of array)	Integer	Optional. Only basic types can be defined as array.
	Flag	Access Flag	None ReadOnly WriteOnly ReadWrite	Optional. Can be omitted if property is read and write enabled.
	Link	Linkage of property	Intern	Mandatory if field has RAPID linkage.
	Alias	Alias name of the property	String	Optional. The alias name is used on device side and in message.

4.1 RAPID programming

# 4 Configuration examples

# 4.1 RAPID programming

#### **RAPID** module

A RAPID module containing the corresponding RAPID record declarations and variable declarations must be created and loaded.

The FlexPendant user interface is not included in RobotWare.

# 4.2 Example configuration

#### Overview

The files Settings.xml, Description.xml, and Configuration.xml are located in the folder HOME\GSI\

xx0800000177

#### Note

The name of the folder must correspond to the name of the device. See *Device* description on page 21. In this example we have used the name *AnyDevice*.

The network address used in Description.xml is to the PC running the server, not the robot controller. See *Device description on page 21*.

#### Settings.xml

```
<?xml version="1.0" encoding="utf-8"?>
<Settings>
    <Servers>
    <Servers/>
    <Clients>
         <Client Convention="CDP" Name="AnyDevice" />
         </Clients>
</Settings</pre>
```

#### **Description.xml**

#### Continued

```
<MaxLost>30</MaxLost>
     <DryRun>false</DryRun>
     </Settings>
</Description>
```

#### Configuration.xml

```
<?xml version="1.0" encoding="utf-8" ?>
<Configuration>
  <Enums>
    <Enum Name="OperationMode" Link="Intern">
      <Member Name="Automatic" Alias="Auto" />
      <Member Name="ReducedSpeed" Alias="ManRS" />
      <Member Name="FullSpeed" Alias="ManFS" />
    </Enum>
  </Enums>
  <Records>
    <Record Name="RobotData">
      <Field Name="OperationMode" Type="OperationMode" Link="Intern"</pre>
           Alias="RobMode" />
    <Field Name="FeedbackTime" Type="Time" Link="Intern"</pre>
         Alias="Ts_act" />
    <Field Name="FeedbackPose" Type="Frame" Link="Intern"</pre>
         Alias="P_act" />
    <Field Name="FeedbackJoints" Type="Joints" Link="Intern"</pre>
         Alias="J_act" />
    <Field Name="PredictedTime" Type="Time" Link="Intern"</pre>
         Alias="Ts_des" />
    <Field Name="PlannedPose" Type="Frame" Link="Intern"</pre>
         Alias="P_des" />
    <Field Name="PlannedJoints" Type="Joints" Link="Intern"</pre>
         Alias="J_des" />
    <Field Name="ApplicationData" Type="Num" Size="18"</pre>
         Alias="AppData" />
    </Record>
    <Record Name="SensorData">
      <Field Name="ErrorString" Type="String" Alias="EStr" />
      <Field Name="ApplicationData" Type="Num" Size="18"</pre>
           Alias="AppData" />
    </Record>
  </Records>
  <Properties>
    <Property Name="RobData" Type="RobotData" Flag="WriteOnly"/>
    <Property Name="SensData" Type="SensorData" Flag="ReadOnly"/>
  </Properties>
</Configuration>
```

#### Continued

#### **RAPID** configuration

This is an example for an RRI implementation. The out data uses an array of 18 num (robdata). The in data receives a string and an array of 18 num (sensdata). This needs to defined according the file configuration.xml.

```
RECORD applicationdata
  num Item1;
  num Item2;
 num Item3;
 num Item4;
 num Item5;
 num Item6;
 num Item7;
 num Item8;
 num Item9;
 num Item10;
 num Item11;
 num Item12;
 num Item13;
 num Item14;
 num Item15;
 num Item16;
 num Item17;
 num Item18;
ENDRECORD
RECORD robdata
  applicationdata AppData;
ENDRECORD
RECORD sensdata
  string ErrString; application data AppData;
ENDRECORD
! Sensor Declarations
PERS sensor AnyDevice := [1,4,0];
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
PERS sensdata DataIn :=
     ["No",[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
! Setup Interface Procedure
PROC RRI_Open()
  SiConnect AnyDevice;
  ! Send and receive data cyclic with 64 ms rate
  SiGetCyclic AnyDevice, DataIn, 64;
  SiSetCyclic AnyDevice, DataOut, 64;
! Close Interface Procedure
PROC RRI_Close()
  ! Close the connection
  SiClose RsMaster;
ENDPROC
ENDMODULE
```

Continued

#### **Transmitted XML messages**

Each XML message has the data variable name as root element with the attributes  ${\tt Id}$  (the message ID) and  ${\tt Ts}$  (the time stamp of the message). The subelements are then the record fields. The values of a multiple value field (array or record) are expressed as attributes.

#### Message sent out from robot controller

The time unit is second (float) with a resolution of 1 ms. The position (length) unit is millimeter (float). The position (angle) unit is radians.

Name	Data type	Description
Id	Integer	Last received robot data message ID
Ts	Float	Time stamp (message)
RobMode	Operationmode	Operation mode
TS_act	Float	Time stamp (actual position)
P_act	Pose	Actual cartesian position
J_act	Joint	Actual joint position
TS_des	Float	Time stamp (desired position)
P_des	Pose	Desired cartesian position
J_des	Joint	Desired joint position
AppData	Array of 18 Floats	Free defined application data

```
<RobData Id="111" Ts="1.202" >
  <RobMode>Auto</RobMode>
  <Ts_act>1.200</Ts_act>
  <P_act X="1620.0" Y="1620.0" Z="1620.0" Rx="100.0" Ry="100.0"
       Rz="100.0" />
  <J_act J1="1.0" J2="1.0" J3="1.0" J4="1.0" J5="1.0" J6="1.0" />
  <Ts_des>1.200</Ts_des>
  <P_des X="1620.0" Y="1620.0" Z="1620.0" Rx="100.0" Ry="100.0"
       Rz="100.0" />
  <J_des J1="1.0" J2="1.0" J3="1.0" J4="1.0" J5="1.0" J6="1.0" />
  <AppData X1="1" X2="1620.000" X3="1620.000" X4="1620.000"</pre>
       X5="1620.000" X6="1620.000" X7="1620.000" X8="1620.000"
       X9="1620.000" X10="1620.000" X11="1620.000" X12="1620.000"
       X13="1620.000" X14="1620.000" X15="1620.000" X16="1620.000"
       X17="1620.000" X18="1620.000" />
</RobData>
```

#### Message received from robot controller

The time unit is seconds (float).

Name	Data type	Description
Id	Integer	Last received data message ID. This ID must correspond to the ID sent from the robot controller.
Ts	Float	Time stamp
EStr	String	Error message

#### Continued

Name	Data type	Description
AppData	Array of 18 floats	Free defined application data

#### The corresponding XML message on the network would look like this:

# 5 RAPID reference information

#### 5.1 RAPID instructions

#### 5.1.1 SiConnect - Sensor Interface Connect

#### Usage

SiConnect is used to establish a connection to an external device.

#### **Basic examples**

A basic example of the instruction SiConnect is illustrated below.

See also More examples on page 33.

#### Example 1

```
PERS sensor AnyDevice;
...
SiConnect AnyDevice;
```

Establish a connection to the device called AnyDevice.

#### **Arguments**

SiConnect Sensor [\NoStop]

Sensor

Data type: sensor

The descriptor for the external device to connect to. The argument is a persistent variable and its name must be the same as the name specified as the client in setup file Settings.xml.

# [\NoStop]

Data type: switch

 $\NoStop$  will prevent system stop when a communication error with the sensor is detected. It can be useful if no robot movements are depending on the sensor. When  $\Nostop$  is used, movements in the system will continue even if the communication with the sensor is lost.

If using  $\NoStop$  it is possible to do error handling in a TRAP routine, with the use of IError or IPers.

#### **Program execution**

Loads the current sensor configuration and establishes the connection to the external device.

The sensor stays connected, even if the program pointer is set to main.

#### More examples

More examples of how to use the instruction SiConnect are illustrated below.

#### Example 1

```
PERS sensor AnyDevice;
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
```

#### 5.1.1 SiConnect - Sensor Interface Connect

#### Continued

When calling routine RRI\_Open, first a connection to the device with name AnyDevice is opened. Then, cyclic transmission is started at rate SampleRate.

#### Example 2

```
PERS sensor AnyDevice;
...
SiConnect AnyDevice \NoStop;
! Send and receive data cyclic with 64 ms rate
SiGetCyclic AnyDevice, DataIn, SampleRate;
SiSetCyclic AnyDevice, DataOut, SampleRate;
...
TRAP sensorChange
IF AnyDevice.state = STATE_ERROR THEN
...
ENDIF
ENDTRAP
```

Establish a connection to the device called AnyDevice with the optional argument \NoStop preventing the system to stop if the connection to AnyDevice is broken. Handle error states in the TRAP routine.

#### **Error handling**

If UDP is used as communication protocol no guarantees are given regarding the success of the connect operation and therefore no error handling is possible at the connect moment.

If TCP is used as communication protocol the system variable  ${\tt ERRNO}$  is set to  ${\tt ERR\_COMM\_INIT}$  if the connect operation fails. This error can then be handled in an error handler.

The switch  $\NoStop$  makes it possible to handle communication errors detected after a successful connect.  $\NoStop$  means that movements and execution of RAPID continues and that a TRAP routine can be used to handle specific errors using IError or specific state changes using IPers.

NOTE: IPers and IError are not safe interrupts, so if an error is detected after a stop, no TRAP will be executed. A way to handle this problem is to have a SiConnect \NoStop in the restart shelf, to be sure that the application tries to reestablish the connection to the client.

## 5.1.1 SiConnect - Sensor Interface Connect

Continued

# Syntax

```
SiConnect
  [ Sensor ':=' ] < persistent (PERS) of sensor >
  [ '\' NoStop ] ';'
```

5.1.2 SiClose - Sensor Interface Close

#### 5.1.2 SiClose - Sensor Interface Close

#### Usage

SiClose closes an existing connection to an external device.

#### **Basic examples**

Basic example of the instruction SiClose is illustrated below.

#### Example 1

```
PERS sensor AnyDevice;
...
SiClose AnyDevice;
```

Close the connection to the device called AnyDevice.

#### **Arguments**

SiClose Sensor

Sensor

Data type: sensor

The descriptor for the external device that should be closed. The argument is a persistent variable, and its name must be the same as the name specified as the client in the setup file Settings.xml.

#### **Program execution**

Closes an existing connection to the external device.

#### **Error handling**

If UDP is used as communication protocol then there is no guarantee regarding the success of the close operation and therefore no error handling is possible. If TCP is used as communication protocol the system variable ERRNO is set to ERR\_COMM\_INIT if the close operation fails. This error can then be handled in an error handler.

#### **Syntax**

```
SiClose
[ Sensor ':=' ] < persistent (PERS) of sensor > ';'
```

#### 5.1.3 SiGetCyclic - Sensor Interface Get Cyclic

# 5.1.3 SiGetCyclic - Sensor Interface Get Cyclic

#### Usage

SiGetCyclic subscribes data for cyclic transmission from an external device.

#### **Basic examples**

A basic example of the instruction SiGetCyclic is illustrated below.

See also More examples on page 38.

#### Example 1

```
SiConnect AnyDevice;
! Receive data cyclic with 64 ms rate
SiGetCyclic AnyDevice, DataIn, 64;
```

The example shows how to establish connection to an external device and set up a cyclic transmission from the device AnyDevice.

## **Arguments**

SiGetCyclic Sensor Data Rate

Sensor

Data type: sensor

A descriptor for the external device to receive cyclic data from. The argument is a persistent variable, and its name must be the same as the name specified as the client in setup file Settings.xml.

Data

Data type: anytype

Reference to a persistent containing the data to receive from the client specified in argument Sensor. The variable must be defined as *Readable* in the file Configuration.xml.

Rate

Data type: num

Transfer rate in milliseconds (only multiples of 4ms are supported).

# **Program execution**

Instruction SiGetCyclic subscribes data for cyclic transmission from an external device.

For SiGetCyclic and SiSetCyclic instructions, a transfer rate of 0 stops (unregisters / unsubscribes) the cyclic transmission of the given data or data set.

#### More examples

More examples of how to use the instruction  ${\tt SiGetCyclic}$  are illustrated below.

# Example 1

```
PERS sensor AnyDevice;
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
```

## Continues on next page

5.1.3 SiGetCyclic - Sensor Interface Get Cyclic

Continued

When calling routine RRI\_Open, first a connection to the device with name AnyDevice is opened. Then, cyclic transmission is started at rate SampleRate.

## **Syntax**

```
SiGetCyclic
[ Sensor ':=' ] < persistent (PERS) of sensor > ','
[ Data ':=' ] < persistent (PERS) of anytype > ','
[ Rate ':=' ] < expression (IN) of num > ] ';'
```

Communication state of a device.	sensorstate - Communication state of the device on page 44.

5.1.4 SiSetCyclic - Sensor Interface Set Cyclic

# 5.1.4 SiSetCyclic - Sensor Interface Set Cyclic

#### Usage

SiSetCyclic registers data for cyclic transmission to an external device.

#### **Basic examples**

A basic example of the instruction SiSetCyclic is illustrated below.

See also More examples on page 40.

#### Example 1

```
PERS sensor AnyDevice;
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
...
    SiConnect AnyDevice;
    SiSetCyclic AnyDevice, DataOut, 40;
```

Establish a connection to the device called AnyDevice. Then register data for cyclic transmission to the external device AnyDevice every 40 ms.

## **Arguments**

SiSetCyclic Sensor Data Rate

Sensor

Data type: sensor

A descriptor for the external device to send data to.

Data

Data type: anytype

Reference to a persistent of any complex or supported simple type containing the data to be sent to the client specified in argument Sensor. The variable must be defined as *Writable* in the Configuration.xml file.

Rate

Data type: num

Transfer rate in milliseconds (only multiples of 4 ms are supported).

#### **Program execution**

Instruction SiSetCyclic registers data for cyclic transmission to an external device.

For SiGetCyclic and SiSetCyclic instructions, a transfer rate of 0 stops (unregisters / unsubscribes) the cyclic transmission of the given data or data set.

## More examples

More examples of how to use the instruction SiSetCyclic are illustrated below.

#### Example 1

```
PERS sensor AnyDevice;
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
```

## Continues on next page

5.1.4 SiSetCyclic - Sensor Interface Set Cyclic

Continued

```
PERS sensdata DataIn :=
        ["No",[0,0,0,0,0,0,0,0,0,0,0,0,0,0]];

VAR num SampleRate:=64;
...
! Setup Interface Procedure

PROC RRI_Open()
    SiConnect AnyDevice;
! Send and receive data cyclic with 64 ms rate
    SiGetCyclic AnyDevice, DataIn, SampleRate;
    SiSetCyclic AnyDevice, DataOut, SampleRate;
ENDPROC
```

When calling routine RRI\_Open, first a connection to the device with name AnyDevice is opened. Then, cyclic transmission is started at rate SampleRate.

## **Syntax**

```
SiSetCyclic
[ Sensor ':=' ] < persistent (PERS) of sensor > ','
[ Data ':=' ] < persistent (PERS) of anytype >
[ Rate ':=' ] < expression (IN) of num > ] ';'
```

5.2.1 sensor - External device descriptor

# 5.2 RAPID data types

# 5.2.1 sensor - External device descriptor

## Usage

sensor is a descriptor to the external device to connect to.

#### **Description**

The descriptor for a device on the RAPID level is encapsulated in the record data type sensor. It holds information about the sensor device such as id, error code and sensor communication state.

#### Components

id

Data type: num

The internal identifier of the device, which will be set on the first operation with the device from RAPID level. (Not implemented yet).

error

Data type: num

The error parameter is set when parameter state is set to STATE\_ERROR. When state goes from STATE\_ERROR to STATE\_CONNECTED parameter error is set to 0.

Error number	Error
0	No error.
112600	Communication interface initialization failed.
112602	Communication interface error.

state

Data type: sensorstate

Reflects the actual communication state of the device.

## **Examples**

Example of the data type sensor is shown below.

## Example 1

```
PERS sensor AnyDevice;
PERS robdata DataOut := [[0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
PERS sensdata DataIn :=
        ["No",[0,0,0,0,0,0,0,0,0,0,0,0,0,0]];
VAR num SampleRate:=64;
...
! Setup Interface Procedure
PROC RRI_Open()
   SiConnect AnyDevice;
! Send and receive data cyclic with 64 ms rate
```

## Continues on next page

5.2.1 sensor - External device descriptor

Continued

```
SiGetCyclic AnyDevice, DataIn, SampleRate;
SiSetCyclic AnyDevice, DataOut, SampleRate;
ENDPROC
```

When calling routine RRI\_Open, first a connection to the device AnyDevice is opened. Then, cyclic transmission is started at rate SampleRate.

#### **Structure**

```
<dataobject of sensor>
  <id of num>
  <error of num>
  <state of sensorstate>
```

Subscribe on cyclic data transmission.	SiGetCyclic - Sensor Interface Get Cyclic on page 38
Communication state of a device.	sensorstate - Communication state of the device on page 44.

5.2.2 sensorstate - Communication state of the device

## 5.2.2 sensorstate - Communication state of the device

#### Usage

sensorstate is used to represent an actual communication state of a device.

## **Description**

A sensorstate constant is used to reflect the actual communication state of a device. It can be used from RAPID to evaluate the state of the connection with the sensor.

#### Predefined data

The following symbolic constants of the data type sensorstate are predefined and can be used to evaluate what communication state the device is in.

Constant	Value
STATE_ERROR	-1
STATE_UNDEFINED	0
STATE_CONNECTED	1
STATE_OPERATING	2
STATE_CLOSED	3

#### **Characteristics**

sensorstate is an alias data type for num and consequently inherits its characteristics.
