Conclusions o o

The road to correct programs

• Program synthesis

- Correct by construction
- Detailed specification
- Hard
- Also, legacy code?

Program verification

Program design + verification + fault localization + repair

Lengthy, iterative cycle

- Long, unreadable error traces
- Essentially manual debugging

Conclusions o o

What are Boolean programs?

- Abstractions of concrete programs
- Boolean variables
- Similar control flow
 - Conditionals, loops, procedures
- Nondeterminism
 - Some expressions may evaluate to either true or false

Automatic Generation of Local Repairs for Boolean Programs

Conclusions o o

Fault/repair model

- Extra statement (needs deletion)
- Assignment: faulty LHS or RHS
- Conditional: faulty G or faulty statement in S_{if} or S_{else}
- Loop: faulty G or faulty statement in Sbody

Our algorithm seeks to repair only the above kinds of faults.

Algorithm sketch

• Annotation:

• Propagate φ and ψ through statements

• Repair:

- Use annotations to inspect statements for repairability
- Generate repair if possible

Assignments: $v_j := E$; $\psi_{i-1} = \psi_i [v'_i \to E$, for each $m \neq j, v'_m \to v_m]$

Rule for sequential composition: $wp((s_{i-1}; s_i), \psi_i) = wp(s_{i-1}, wp(s_i, \psi_i))$

Conditionals: if (G) S_{if} else S_{else} ; $\psi_{i-1} = (G \Rightarrow wp(S_{if}, \psi_i)) \land (\neg G \Rightarrow wp(S_{else}, \psi_i))$

Loops: while (G) S_{body} ; $\psi_{i-1} = (\psi_i \wedge \neg G) \vee \bigvee_{l=1}^{L} wp(S_{body}, Y_{l-1} \wedge \neg G)$ where, $Y_0 = \psi_i$, $Y_k = wp(S_{body}, Y_{k-1} \wedge \neg G)$

Forward propagation of φ_{i-1} through s_i

Strongest post-condition $sp(s_i, \varphi_{i-1})$: Smallest set of *output* states in which s_i is guaranteed to terminate, starting in φ_{i-1} , for all choices that s_i might make.

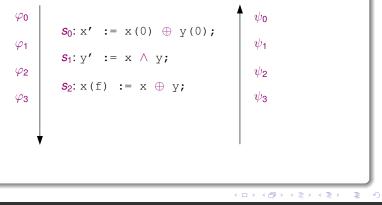

To propagate φ_{i-1} forward through s_i , compute $sp(s_i, \varphi_{i-1})$.

A key lemma

$\langle \varphi \rangle \mathcal{P} \langle \psi \rangle$ false \Leftrightarrow all local Hoare triples false. All local Hoare triples false \Leftrightarrow some local Hoare triple false.

What does this lemma mean for us?

If for some *i*, s_i can be fixed to make $\langle \varphi_{i-1} \rangle s_i \langle \psi_i \rangle$ true, then we have found \mathcal{P}' such that $\langle \varphi \rangle \mathcal{P}' \langle \psi \rangle$!

This is the basis for our repair algorithm.
