Preface

I have enriched, perfected, and further developed relativity, particle physics and quantum field theory in this book. Generally, a rigorous, analytical, elegant description method is adopted. I try best to impart a mathematical and physical aesthetic feeling to the entire article. The first seventeen chapters of this book are the basic parts. Several very useful mathematical tools have been proposed. Specially I have independently developed and created the constant invariant tensors analysis method for physical research. And I have restated classical physics in my own way. Most of the content belongs to the fields of classical field theory and quantum mechanics. The later chapters of Chapter 18 are the advanced parts. Most of the content belongs to the fields of quantum field theory. In particular, a new quantization program is given. According to this program, the quantization of arbitrary spin linear particles is completed in arbitrary space-time. These have greatly enriched and expanded the content of quantum field theory.

More specifically, in the first, second, and third chapters, I have independently developed and created the constant invariant tensors analysis method [1–3]. Some wonderful mathematical properties have been found and many important and useful constant invariant tensors have been proposed. It provides a very useful mathematical tool for physical research. In chapter 4, the constant invariant tensors are generalized in both high and low dimensional space-time and infinite dimensional representation. In Chapter 5, the essential relation between the constant invariant tensors and the representation transformations is pointed out. In Chapters 6, 7, 8, and 9, I used mathematical tools such as the constant tensor analysis established in the previous three chapters to reformulate the equations of electromagnetic fields, Yang-Mills fields, gravitational fields, and gravitational neutrino fields [4–14]. Various equivalent expressions have been proposed [1,2]. And I have strictly analytically proved the equivalence between various expressions. In particular, the spinor form of the bianchi identity [11–14] for the gravitational field has been obtained through analysis.

Chapter 10 is the most important part of this book. It is also my original intention to write this book at the beginning. In this chapter, I have independently and creatively proposed a new expression of the particle equations: the Spin Equation. This equation is directly constructed by using spin and the spin tensor matrix. Noting that the spin tensor is also a transformation matrix corresponding to the representation of the field. Therefore, the physical meaning of this equation is very clear. The corresponding particle equation can be simply and directly written according to the particle field quantity transformation law. It correctly describes classical equations such as neutrinos [5], electromagnetic fields [7,8], Yang Mills fields [6], and electrons [4]. And I have found that its massless representation is completely equivalent to the full symmetric Penrose spinor equation [1,2]. Of course, it is more extensive than the Penrose spinor equation and can describe more physical equations. I continue to use the idea of spin expression to further obtain a lower order derivative spin equation that correctly describes the Einstein's gravitational field and the gravitational neutrinos.In these spin representations, it is very natural to introduce a scalar field. Thus, a more interesting equation is generalized: the witch Spin Equation. When the scalar field is zero, free particles can exist. When the scalar field is not zero, free particles do not exist. This scalar field acts like a switch and controlls the generation and annihilation of particles. This provides a new physical mechanism for the generation and annihilation of particles. At the same time, it can also answer why the inflationary period of the universe [15] can be completely described only by scalar fields. And this equation itself has inherent limitations on scalar fields. Thereby the scalar field is automatically quantized. Each quantized value corresponds to a distinct physical equation, one corresponds to a classical particle equation, one corresponds to an equation similar to torsion, and one corresponds to a constant trivial solution. This provides a new idea and inspiration for the unified expression of the five superstrings.

In Chapters 11 to 12, I have conducted a comprehensive and in-depth analysis of the Penrose spinor equation [1,2], the Penrose twist equation [3], and the Bargmann-Wigner equation [16]. In a flat space-time, it is strictly proved that the Bargmann Wigner equation is equivalent to the Rarita Schwinger equation [17,18] in the case of semi integer spin [19,20] and equivalent to the Klein-Gordon equation [18,21] in the case of integer spin [20]. The profound physical connotation of the Bargmann Wigner equation has been revealed. Through comparative research, it is found that the Bargmann

Wigner equation is more suitable for describing particles with mass, while the Penrose spinor equation or the Spin Equation is more suitable for describing particles without mass.

Chapter 13 further enriches and deepens the content of the previous chapters. I study the same physical problem from the perspective of representation transformation. This provides a mathematical basis for the subsequent proof of the polynomial representation of the Lorentz transformation of various spin particles. At the same time, a fully new particle coupling theory is proposed by using representation transformation technology. In Chapter 14, I have made a detailed and in-depth analysis of the Lorentz transformation [22–24]. In particular, the polynomial representations of Lorentz transformation for various common spin particles have been obtained. It will provide another very useful mathematical tool for the future research of various spin particle physics. In Chapters 15 to 17, the mathematical analyses of helicity, spin algebra, special quasi differential operators and matrix continuous multiplication traces have been established. It provides several very useful mathematical tools for quantizing arbitrary spin massless particles successfully in the next step.

In Chapter 18, I fully utilize the four-dimensional Fourier transform technique to discuss the details of the second quantization of non relativistic particles. Because most books on quantum field theory do not discuss the quantization of Majorana particles and neutrinos in detail [25] and I have never found the corresponding content. In order to make up for this regret, I decide to deduce the calculation by myself. In Chapter 19, firstly I have given the quantization of Dirac particles [25,26] by using Lorentz push transformation. And then by using similar techniques on this basis, I have further given detailed quantizati details of Majorana particles and neutrinos. In Chapters 20 to 23, I apply the mathematical tools and constant invariant tensor analysis created in the previous chapters to quantize various massless spin particles successfully according to the new covariant quantization program. In particular, a separate chapter on scalar fields and electromagnetic fields has been discussed in detail. Thus the rationality and correctness of the new quantization program has been confirmed by comparing with classical results. On this basis, various massless spin particles have been successfully quantized by using the same and unified program.

In Chapters 24 to 29, based on the Bargmann Wigner equation and comparing the successful experience of quantizing massless particles, various massive spin particles have been quantized in the new unified formula. Several covariant commutative rules for equivalent fields or potentials have been given. In particular, a mathematical conjecture on combinatorics has been proposed. In Chapter 30, I have reorganized and analyzed the spin bases of various equations in the previous chapters. The logical deduction relation of spin base decomposition and the spin base decomposition relation under different representations have been clarified. It is further demonstrated that the spin base are the common eigenstates of general spin operators. And the spin base decomposition coefficients are just the CG coefficients. In Chapter 31, I generalized and developed the polynomial theorem for full symmetric indicators. This provides mathematical support for the previous step of unifying to quantize massive particles by using the new program. At the same time, based on the formula constructed by Behrends and Frontsdal in history, and combined with my new conclusions, I have obtained a very meaningful projection operator conjecture.

In Chapter 32, I have discussed the essential relation between CG coefficients, spin coupling, and quantum entanglement. And I have provided a wonderful mathematical description of spin entangled states based on representation transformation technology. In Chapter 33, I have ventured to speculate on a new type of interaction: internal particle component interactions. Whether it is correct that will remain to be verified by practice. In Chapter 34, I have used similar mathematical techniques to uniformly treat various symmetric and antisymmetric plane wave solutions. In Chapters 35 to 38, I have tried to unify the quantization of all particles in high and low dimensional space-time by using the new program, and conducted a lot of meaningful promotion and exploration. A series of achievements have been achieved. And the conclusions completely similar to those in four-dimensional space-time have been obtained. In particular, antisymmetric tensor fields have naturally emerged. This is a wonderful conclusion that I didn't expect.

In Chapters 39 and 40, I have discussed Bose strings, two-dimensional spinors, two-dimensional vectors, and anyons. We have discussed two-dimensional supersymmetry and superstring. This is to prepare for the application of the new quantization program to supersymmetry and superstring theory. However, no suitable entry point has yet been found. In particular, this book is actually an open topic. There are some issues that have not been resolved. For example, the new quantization program is powerless to quantize the nonlinear Yang-Mills field and Einstein gravitational field. Because it cannot be treated as a free field at this time, and it is necessary to consider self interaction and corresponding Feynman rules. This is also one of the directions to be resolved and explored in the next step.

The mathematics and physics in this book are highly original, and some mathematical and physical concepts, methods, and content are also novel. They are all strictly established by my own independent calculation and deduction step by step. More formal research can be traced back to more than

a decade ago [27]. As early as May 2004, the basic part of the current theoretical system was initially established. It lasted for several years, but it greatly affected my normal life, so I once wanted to completely forget it. So there was a break for a few years. Despite this, my interest in theoretical physics has not diminished. Later, a new round of research was launched eight years ago. Since March 2015, I have been writing continuously [28–32]. It never stopped. It consumed a lot of my time and energy. And I have used spare time to write for a long time. Specially I thank to my family for their understanding and support over the years! Because many topics in this book involve entirely new fields. It is challenging and open and have been filled with many conjectures, explorations, verifications and proofs. Some mathematical and physical problems have only been mostly solved, but they have not been completely solved. In addition due to my limited level, I can't cover all aspects. There are inevitably errors in the book and everyone is welcome to correct them!

Chapter1 Constant Invariant Tensors Analysis

Self comment: In this chapter, I have developed and created a constant invariant tensors analysis method. I inspired and developed it by known constant invariant tensors. In this chapter, a large number of new fundamental constant invariant tensors have been discovered. And they are closely related to physics and have natural covariance and invariance. It is very convenient and useful to use. It is a new mathematical tool for physical research. In fact, my original intention in developing this mathematical tool is to apply it to physical research.

1 Similar Penrose abstract indices [1,2]

Symbol convention:

$\varsigma = \pm 1$.

$\sim$ means a Lorentz transformation.

$\prec$ means that the matrix is expanded into components.

$\succ$ means that the components are reduced to a matrix.

Self comment: This section has developed and promoted the Penrose abstract indices. The $\frac{1}{2}$-spin indices are extended to the general spin indices. And dual representation indices have been introduced. The dual representation indices correspond to two representations of massless particles. The advantages of this approach are in duplicate. One expression presents two representations simultaneously. One processing obtains two results simultaneously. Such abstract indices are more beautiful, complete and powerful.

1.1 Hermitian spin matrix $\sigma(s)$ under general representation

$$\sigma(s) \times \sigma(s) = i\sigma(s), \sigma^2(s) = s(s+1), \sigma^+(s) = \sigma(s) \tag{1.1}$$

1.2 A concrete representation of hermitian spin matrix [33]

$$\sigma(s) = (\frac{1}{2}\begin{bmatrix} 0 & A_1 & 0 & 0 & 0 \\ A_1 & 0 & A_2 & 0 & 0 \\ 0 & A_2 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & A_{2s} \\ 0 & 0 & 0 & A_{2s} & 0 \end{bmatrix}, \frac{i}{2}\begin{bmatrix} 0 & -A_1 & 0 & 0 & 0 \\ A_1 & 0 & -A_2 & 0 & 0 \\ 0 & A_2 & 0 & \cdots & 0 \\ 0 & 0 & \cdots & 0 & -A_{2s} \\ 0 & 0 & 0 & A_{2s} & 0 \end{bmatrix}, \begin{bmatrix} s & 0 & 0 & 0 & 0 \\ 0 & s-1 & 0 & 0 & 0 \\ 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 0 & -(s-1) & 0 \\ 0 & 0 & 0 & 0 & -s \end{bmatrix}) \tag{1.2a}$$

$$A_n = \sqrt{n} \cdot \sqrt{2s+1-n}, n = 1, 2, \cdots, 2s; \sigma(s) \prec \sigma_{\alpha_\varsigma k_\varsigma}{}^{l_\varsigma}(s) \simeq \sigma_{\alpha'_\varsigma}{}^{k'_\varsigma}{}_{l'_\varsigma}(s) \tag{1.2b}$$

$$\sigma(s) \times \sigma(s) = i\sigma(s), \sigma^2(s) = s(s+1), \sigma^+(s) = \sigma(s), s = \frac{1}{2}, 1, \frac{3}{2}, 2, \cdots \tag{1.2c}$$

The metric tensor corresponding to this spin matrix is as follows:

$$\varepsilon(s) = \begin{bmatrix} 0 & 0 & 0 & 0 & (-1)^0 \\ 0 & 0 & 0 & (-1)^1 & 0 \\ 0 & 0 & (-1)^2 & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 \\ (-1)^{2s} & 0 & 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & -1 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & \cdots & 0 & 0 & 0 \\ (-1)^{2s} & 0 & 0 & 0 & 0 \end{bmatrix}, \sigma^*(s) = (-1)^{2s+1}\varepsilon(s)\sigma(s)\varepsilon(s) \tag{1.3}$$

$$\varepsilon(s) \prec \varepsilon_{k_\varsigma l_\varsigma}(s) \simeq \varepsilon^{k_\varsigma l_\varsigma}(s) \simeq \varepsilon_{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon^{k'_\varsigma l_\varsigma}(s), \varepsilon^2(s) = (-1)^{2s} \tag{1.4}$$

Self comment: Essentially, there are infinite choices for selecting a spin matrix, which can be Hermitian or not Hermitian. This book mainly uses the Hermitian spin matrix represented by the above special representation. The reason for doing so is that the observations must be Hermitian in quantum mechanics. And another reason is that under this representation of the spin matrix, there exist several perfect constant invariant tensors in the next chapter. If other representations of the spin matrix are used, such perfect constant invariant tensors can't be obtained. In fact, I initially used a full integer spin matrix. On the surface, it seems more beautiful, but has not the above two advantages. Finally, I have abandoned it and adopted the current hermitian representation.

1.3 Carding complex properties of spin matrix

$$\sigma_x^2(s)=\frac{1}{4}\begin{bmatrix} A_1^2 & 0 & A_1A_2 & 0 & 0 & 0 & 0\\ 0 & A_2^2{+}A_1^2 & 0 & A_2A_3 & 0 & 0 & 0\\ A_1A_2 & 0 & A_3^2{+}A_2^2 & 0 & \cdots & 0 & 0\\ 0 & A_2A_3 & 0 & \cdots & 0 & A_{2s-2}A_{2s-1} & 0\\ 0 & 0 & \cdots & 0 & A_{2s-1}^2{+}A_{2s-2}^2 & 0 & A_{2s-1}A_{2s}\\ 0 & 0 & 0 & A_{2s-2}A_{2s-1} & 0 & A_{2s}^2{+}A_{2s-1}^2 & 0\\ 0 & 0 & 0 & 0 & A_{2s-1}A_{2s} & 0 & A_{2s}^2 \end{bmatrix} \tag{1.5}$$

1.4 Lorentz transformation parameters ϑ^{ab} and spin tensor $S_{ab}(s,\varsigma)$ in orthogonal frame (The book adopts this frame.)

$\epsilon\in R$ means the velocity of O'(particle) relative to O. $\omega\in R$ means the rotation angle of O'(particle) relative to O. Self comment: In this way, the understanding of physics will not be confused. Especially over time, it is easy to confuse the correspondence between parameters and real physics. Generally, it is a different symbolIn case you forget, you can come back here and make a clean slate.

Self comment: In essence, there are also infinite selection methods for frame selection. There are several commonly used ones. This book uses the orthogonal frame of this section. The advantage of this is that constant invariant tensors are simpler, more uniform and more regular in this frame. Of course, it can also be transformed to other frame representations through equivalent transformation.

1.6 s-spin spinor index

s-spin spinor index definition: Use lower-case Arabic letters $\{i,j,k,l,m,n,p,q,r,s\}$ to especially represent general spin cases.

$$_{k_\varsigma} \sim e^{\frac{i}{2}\vartheta^{ab}S_{ab}(s,\varsigma)} = e^{(i\omega+\varsigma\epsilon)\cdot\sigma(s)} \quad \Leftrightarrow_{k_+} :=_k \sim e^{(i\omega+\epsilon)\cdot\sigma(s)} \quad _{k_-} :=^{k'} \sim e^{(i\omega-\epsilon)\cdot\sigma(s)} \tag{1.23}$$

$$^{k_\varsigma} \sim e^{-\frac{i}{2}\vartheta^{ab}S^T_{ab}(s,\varsigma)} = e^{-(i\omega+\varsigma\epsilon)\cdot\sigma^T(s)} \quad \Leftrightarrow^{k_+} :=^k \sim e^{-(i\omega+\epsilon)\cdot\sigma^T(s)} \quad ^{k_-} :=_{k'} \sim e^{-(i\omega-\epsilon)\cdot\sigma^T(s)} \tag{1.24}$$

$$ {}_{k'_\varsigma} \sim e^{\frac{i}{2}\vartheta^{ab}S_{ab}(s,-\varsigma)} = e^{(i\omega-\varsigma\epsilon)\cdot\sigma(s)} \qquad \Leftrightarrow {}^{k'_+} := {}^{k'} \sim e^{(i\omega-\epsilon)\cdot\sigma(s)} \qquad {}^{k'_-} := {}_{k} \sim e^{(i\omega+\epsilon)\cdot\sigma(s)} \tag{1.25} $$

$$ {}_{k'_\varsigma} \sim e^{-\frac{i}{2}\vartheta^{ab}S^T_{ab}(s,-\varsigma)} = e^{-(i\omega-\varsigma\epsilon)\cdot\sigma^T(s)} \qquad \Leftrightarrow {}_{k'_+} := {}_{k'} \sim e^{-(i\omega-\epsilon)\cdot\sigma^T(s)} \qquad {}_{k'_-} := {}^{k} \sim e^{-(i\omega+\epsilon)\cdot\sigma^T(s)} \tag{1.26} $$

Indices relation: Indices are identical and spinors are also identical, which is a definition.

$$ \begin{cases} {}^{k_\varsigma} \equiv {}_{k'_{-\varsigma}} \\ {}^{k_{-\varsigma}} \equiv {}_{k'_\varsigma} \end{cases} \quad \begin{cases} {}_{k_\varsigma} \equiv {}^{k'_{-\varsigma}} \\ {}_{k_{-\varsigma}} \equiv {}^{k'_\varsigma} \end{cases} \quad \begin{cases} {}^{k_+} \equiv {}_{k'_-} \equiv {}^{k} \\ {}^{k_-} \equiv {}_{k'_+} \equiv {}_{k'} \end{cases} \quad \begin{cases} {}_{k_+} \equiv {}^{k'_-} \equiv {}_{k} \\ {}_{k_-} \equiv {}^{k'_+} \equiv {}^{k'} \end{cases} \tag{1.27} $$

Conjugate indices: If indices are equal then spinors may be equal or not. And they are equal only under the special hermitian representation.

$$ \begin{cases} ({}^{k_\varsigma})^* = {}^{k'_\varsigma} \\ ({}_{k_\varsigma})^* = {}_{k'_\varsigma} \end{cases} \quad \begin{cases} ({}^{k'_\varsigma})^* = {}^{k_\varsigma} \\ ({}_{k'_\varsigma})^* = {}_{k_\varsigma} \end{cases} \quad \begin{cases} ({}^{k})^* = {}^{k'} \\ ({}_{k})^* = {}_{k'} \end{cases} \quad \begin{cases} ({}^{k'})^* = {}^{k} \\ ({}_{k'})^* = {}_{k} \end{cases} \tag{1.28} $$

The metric tensor corresponding to the s-spin spinor index and the self consistent raising and lowering rules are as follows:

$$ \begin{cases} \varepsilon_{k_\varsigma l_\varsigma}(s) \simeq \varepsilon^{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon_{k'_\varsigma l'_\varsigma}(s) \simeq \varepsilon^{k_\varsigma l_\varsigma}(s) \succ \varepsilon(s) \\ \psi_{k_\varsigma} = (-\varsigma)^{2s}\varepsilon_{k_\varsigma l_\varsigma}(s)\psi^{l_\varsigma}, \psi^{k_\varsigma} = \varsigma^{2s}\varepsilon^{k_\varsigma l_\varsigma}(s)\psi_{l_\varsigma} \\ \psi_{k'_\varsigma} = (-\varsigma)^{2s}\varepsilon_{k'_\varsigma l'_\varsigma}(s)\psi^{l'_\varsigma}, \psi^{k'_\varsigma} = \varsigma^{2s}\varepsilon^{k'_\varsigma l'_\varsigma}(s)\psi_{l'_\varsigma} \end{cases} \tag{1.29} $$

The essence of self consistent raising and lowering rules is as follows. The rules are consistent with those of Penrose, and the Penrose indices are consistent with my indices.

$$ \begin{cases} \varepsilon_{k'l'}(s) = [\varepsilon_{kl}(s)]^* \simeq \varepsilon_{kl}(s), \varepsilon^{k'l'}(s) = [\varepsilon^{kl}(s)]^* \simeq \varepsilon^{kl}(s) \\ \psi_k = (-1)^{2s}\varepsilon_{kl}(s)\psi^l, \psi^k = \varepsilon^{kl}(s)\psi_l \\ \psi_{k'} = (-1)^{2s}\varepsilon_{k'l'}(s)\psi^{l'}, \psi^{k'} = \varepsilon^{k'l'}(s)\psi_{l'} \end{cases} \tag{1.30} $$

Self comment: Why is it necessary to specify the raising and lowering rules for new abstract indicators in this way. There are two main considerations. First tries to be consistent with the Penrose abstract indices rules and the second is the inherent self consistency requirements of the new abstract indices. It is also a summary and refinement of the later actual calculation of a large number of constant invariant tensors.

1.7 $\frac{1}{2}$-spin spinor index

$\frac{1}{2}$-spin spinor index is a special case of s-spin spinor index. In order to be consistent with the Penrose abstract index, the Arabic capital letters $\{A, B, C, \cdots\}$ are still used to specifically represent the $\frac{1}{2}$-spin case. The definitions and rules are shown in the above section($s = \frac{1}{2}$).

1.8 Complex vector index

Photon spin matrix: Greek letters $\{\alpha, \beta, \gamma, \cdots\}$ are used to specifically represent the complex vector indices.

$$ \gamma = \{ \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & i \\ 0 & 0 & 0 \\ -i & 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & -i & 0 \\ i & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \} \tag{1.31} $$

Take $\sigma(1) = \gamma$ to obtain the complex vector index, as follows:

$$ \alpha_\varsigma \sim e^{(i\omega+\varsigma\epsilon)\cdot\gamma} \qquad \Leftrightarrow \alpha_+ := \alpha \sim e^{(i\omega+\epsilon)\cdot\gamma} \qquad \alpha_- := \alpha' \sim e^{(i\omega-\epsilon)\cdot\gamma} \tag{1.32} $$

$$ \alpha'_\varsigma \sim e^{(i\omega-\varsigma\epsilon)\cdot\gamma} \qquad \Leftrightarrow \alpha'_+ := \alpha' \sim e^{(i\omega-\epsilon)\cdot\gamma} \qquad \alpha'_- := \alpha \sim e^{(i\omega+\epsilon)\cdot\gamma} \tag{1.33} $$

Indices relation:

$$ \alpha_\varsigma \equiv \alpha'_{-\varsigma}, \alpha_{-\varsigma} \equiv \alpha'_\varsigma; \alpha_+ \equiv \alpha'_- \equiv \alpha, \alpha_- \equiv \alpha'_+ \equiv \alpha \tag{1.34} $$

Conjugate relation:

$$ (\alpha_\varsigma)^* \equiv \alpha'_\varsigma, (\alpha'_\varsigma)^* \equiv \alpha_\varsigma; (\alpha)^* \equiv \alpha', (\alpha')^* \equiv \alpha \tag{1.35} $$

Metric tensors and raising and lowering rules corresponding to complex vector indices:

$$ \begin{cases} g_{\alpha_\varsigma\beta_\varsigma} = \delta_{\alpha_\varsigma\beta_\varsigma} \succ I, g^{\alpha_\varsigma\beta_\varsigma} = \delta^{\alpha_\varsigma\beta_\varsigma} \succ I \\ g_{\alpha'_\varsigma\beta'_\varsigma} = \delta_{\alpha'_\varsigma\beta'_\varsigma} \succ I, g^{\alpha'_\varsigma\beta'_\varsigma} = \delta^{\alpha'_\varsigma\beta'_\varsigma} \succ I \end{cases}, \begin{cases} \psi_{\alpha_\varsigma} = g_{\alpha_\varsigma\beta_\varsigma}\psi^{\beta_\varsigma}, \psi^{\alpha_\varsigma} = g^{\alpha_\varsigma\beta_\varsigma}\psi_{\beta_\varsigma} \\ \psi^{\alpha'_\varsigma} = g^{\alpha'_\varsigma\beta'_\varsigma}\psi_{\beta'_\varsigma}, \psi_{\alpha'_\varsigma} = g_{\alpha'_\varsigma\beta'_\varsigma}\psi^{\beta'_\varsigma} \end{cases} \tag{1.36} $$

At this point, the metric tensor is the identity matrix. It is not necessary to distinguish between inverse and covariant tensors. Superscripts and subscripts can be synchronously exchanged at will.
Self comment: The complex vector index is derived from the description of electromagnetic fields, Yang-Mills fields, and gravitational fields, so it is also particularly suitable for describing them.

1.9 Vector index

The spatial rotation matrix R and the Lorentz boost matrix L:

$$R=\{\begin{bmatrix}0&0&0&0\\0&0&-i&0\\0&i&0&0\\0&0&0&0\end{bmatrix},\begin{bmatrix}0&0&i&0\\0&0&0&0\\-i&0&0&0\\0&0&0&0\end{bmatrix},\begin{bmatrix}0&-i&0&0\\i&0&0&0\\0&0&0&0\\0&0&0&0\end{bmatrix}\},L=\{\begin{bmatrix}0&0&0&i\\0&0&0&0\\0&0&0&0\\-i&0&0&0\end{bmatrix}\begin{bmatrix}0&0&0&0\\0&0&0&i\\0&0&0&0\\0&-i&0&0\end{bmatrix}\begin{bmatrix}0&0&0&0\\0&0&0&0\\0&0&0&i\\0&0&-i&0\end{bmatrix}\} \quad (1.37)$$

Vector index is as follow: Lower-case Arabic letters $\{a,b,c,d,e,f,g,h,u,v,w\}$ are used to specifically represent the vector indices.

$$a_\varsigma\sim e^{(i\omega\cdot R+\varsigma\epsilon\cdot L)} \quad \Leftrightarrow a_+:=a\sim e^{\vartheta}=e^{(i\omega\cdot R+\epsilon\cdot L)} \quad a_-:=a'\sim e^{\vartheta^*}=e^{(i\omega\cdot R-\epsilon\cdot L)} \quad (1.38)$$

$$a'_\varsigma\sim e^{(i\omega\cdot R-\varsigma\epsilon\cdot L)} \quad \Leftrightarrow a'_+:=a'\sim e^{\vartheta^*}=e^{(i\omega\cdot R-\epsilon\cdot L)} \quad a'_-:=a\sim e^{\vartheta}=e^{(i\omega\cdot R+\epsilon\cdot L)} \quad (1.39)$$

Indices relation:

$$a_\varsigma\equiv a'_{-\varsigma},a_{-\varsigma}\equiv a'_\varsigma;a_+\equiv a'_-\equiv a,a_-\equiv a'_+\equiv a' \quad (1.40)$$

Conjugate relation:

$$(a_\varsigma)^*\equiv a'_\varsigma,(a'_\varsigma)^*\equiv a_\varsigma;(a)^*\equiv a',(a')^*\equiv a \quad (1.41)$$

Metric tensors and raising and lowering rules corresponding to vector indices:

$$\begin{cases}g_{a_\varsigma b_\varsigma}=\delta_{a_\varsigma b_\varsigma}\succ I,g^{a_\varsigma b_\varsigma}=\delta^{a_\varsigma b_\varsigma}\succ I\\g_{a'_\varsigma b'_\varsigma}=\delta_{a'_\varsigma b'_\varsigma}\succ I,g^{a'_\varsigma b'_\varsigma}=\delta^{a'_\varsigma b'_\varsigma}\succ I\end{cases},\begin{cases}\psi_{a_\varsigma}=g_{a_\varsigma b_\varsigma}\psi^{b_\varsigma},\psi^{a_\varsigma}=g^{a_\varsigma b_\varsigma}\psi_{b_\varsigma}\\\psi^{a'_\varsigma}=g^{a'_\varsigma b'_\varsigma}\psi_{b'_\varsigma},\psi_{a'_\varsigma}=g_{a'_\varsigma b'_\varsigma}\psi^{b'_\varsigma}\end{cases} \quad (1.42)$$

At this point, the metric tensor is the identity matrix. It is not necessary to distinguish between inverse and covariant tensors. Superscripts and subscripts can be synchronously exchanged at will.

2 Common Matrices

2.1 Pauli matrix

$$\sigma=\{\begin{bmatrix}0&1\\1&0\end{bmatrix},\begin{bmatrix}0&-i\\i&0\end{bmatrix},\begin{bmatrix}1&0\\0&-1\end{bmatrix}\},tr(\sigma_{\alpha_\varsigma})=0,tr(\sigma_{\alpha_\varsigma}\sigma_{\beta_\varsigma})=2\delta_{\alpha_\varsigma\beta_\varsigma} \quad (1.43)$$

$$[\sigma_{\alpha_\varsigma},\sigma_{\beta_\varsigma}]=2i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\sigma_{\gamma_\varsigma},\{\sigma_{\alpha_\varsigma},\sigma_{\beta_\varsigma}\}=2\delta_{\alpha_\varsigma\beta_\varsigma},\sigma^2(\tfrac{1}{2})=\tfrac{1}{2}(\tfrac{1}{2}+1) \quad (1.44)$$

2.2 Photon matrix

$$\gamma=\{\begin{bmatrix}0&0&0\\0&0&-i\\0&i&0\end{bmatrix},\begin{bmatrix}0&0&i\\0&0&0\\-i&0&0\end{bmatrix},\begin{bmatrix}0&-i&0\\i&0&0\\0&0&0\end{bmatrix}\},tr(\gamma_{\alpha_\varsigma})=0,tr(\gamma_{\alpha_\varsigma}\gamma_{\beta_\varsigma})=2\delta_{\alpha_\varsigma\beta_\varsigma} \quad (1.45)$$

Self comment: This pair of constant invariant tensors is essentially two generator matrices of $SO(4)$. Gerard't Hooft had also used it, called Gerard't Hooft η matrix. This pair of constant invariant tensors also appeared in the construction of Ashtekar action in loop quantum gravity. But they don't be called constant invariant tensors. Here it appears in more places, is everywhere and is widely used. It is a very useful fundamental constant invariant tensor, closely related to the spin matrix. By using them, I can also obtain a new expression of the electromagnetic field and Yang-Mills field equation: the integral spinor expression.

3 Discovery and proof of constant invariant tensors

3.1 Various common metric constant invariant tensors

Self comment: The constant invariant tensors in this section had already existed in mathematics and physics before I developed this mathematical theory. It was inspired by them and Penrose spinor analysis. So that I wanted to develop a general constant invariant tensors theory. And I apply it to physics. It provides a useful mathematical tool for physical research.

3.1.1 Four vector metric constant invariant tensors $\delta_{a_\varsigma b_\varsigma},\delta^{a_\varsigma b_\varsigma},\delta_{a'_\varsigma b'_\varsigma},\delta^{a'_\varsigma b'_\varsigma}$

Lem. 3.2.3. $\frac{1}{2}\epsilon\cdot\{\Gamma,\Gamma_{\alpha_\varsigma}\}=\epsilon_{\alpha_\varsigma},\forall\epsilon\to0\Leftrightarrow\{\Gamma_{\alpha_\varsigma},\Gamma_{\beta_\varsigma}\}=2\delta_{\alpha_\varsigma\beta_\varsigma}$

Lem. 3.2.4. $\vartheta_{ij}=\varepsilon_{ijk}\omega^k,\vartheta_{i\pi}=i\epsilon_i,\vartheta_{\pi j}=-i\epsilon_j,\omega_k=\frac{1}{2}\varepsilon_{kij}\vartheta^{ij}$

3.2.2 Fundamental theorem 1

The following theorem exists in 4-dimensional space-time.

Thm. 3.2.1. $(\Gamma, i\varsigma)_a = [e^{(i\omega\cdot R+\epsilon\cdot L)}]_a{}^b e^{(i\omega+\varsigma\epsilon)\cdot\frac{1}{2}\Gamma}(\Gamma, i\varsigma)_b e^{-(i\omega-\varsigma\epsilon)\cdot\frac{1}{2}\Gamma} \Leftrightarrow \begin{cases}[\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}] = 2i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\Gamma_{\gamma_\varsigma} \\ \{\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}\} = 2\delta_{\alpha_\varsigma\beta_\varsigma}\end{cases}$

Proof: $(\Gamma, i\varsigma)_a = [e^{(i\omega\cdot R+\epsilon\cdot L)}]_a{}^b e^{(i\omega+\varsigma\epsilon)\cdot\frac{1}{2}\Gamma}(\Gamma, i\varsigma)_b e^{-(i\omega-\varsigma\epsilon)\cdot\frac{1}{2}\Gamma}, \forall\omega, \forall\epsilon$
$\Leftrightarrow (\Gamma, i\varsigma)_a = (\delta_a{}^b + \vartheta_a{}^b)(1 + (i\omega+\varsigma\epsilon)\cdot\frac{1}{2}\Gamma)(\Gamma, i\varsigma)_b(1 - (i\omega-\varsigma\epsilon)\cdot\frac{1}{2}\Gamma), \forall\omega\to 0, \forall\epsilon\to 0$
$\Leftrightarrow 0 = \vartheta_a{}^b(\Gamma, i\varsigma)_b + \frac{1}{2}i\omega\cdot[\Gamma, (\Gamma, i\varsigma)_a] + \frac{1}{2}\epsilon\cdot\{\Gamma, (\Gamma, i\varsigma)_a\}, \forall\omega\to 0, \forall\epsilon\to 0$
$\Leftrightarrow 0 = (-\omega\times\Gamma - \varsigma\epsilon, -i\epsilon\cdot\Gamma)_a + \frac{1}{2}i\omega\cdot[\Gamma, (\Gamma, i\varsigma)_a] + \frac{1}{2}\epsilon\cdot\{\Gamma, (\Gamma, i\varsigma)_a\}, \forall\omega\to 0, \forall\epsilon\to 0$
$\Leftrightarrow 0 = (-\omega\times\Gamma - \varsigma\epsilon)_{\alpha_\varsigma} + \frac{1}{2}i\omega\cdot[\Gamma, \Gamma_{\alpha_\varsigma}] + \frac{1}{2}\epsilon\cdot\{\Gamma, \Gamma_{\alpha_\varsigma}\}, \forall\omega\to 0, \forall\epsilon\to 0$
$\Leftrightarrow \frac{1}{2}i\omega\cdot[\Gamma, \Gamma_{\alpha_\varsigma}] = (\omega\times\Gamma)_{\alpha_\varsigma}, \frac{1}{2}\epsilon\cdot\{\Gamma, \Gamma_{\alpha_\varsigma}\} = \epsilon_{\alpha_\varsigma}, \forall\omega\to 0, \forall\epsilon\to 0$

The above theorem indicates: The commutative relation $[\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}] = 2i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\Gamma_{\gamma_\varsigma}$ and anti commutative relation $\{\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}\} = 2\delta_{\alpha_\varsigma\beta_\varsigma}$ mean that $(\Gamma, i\varsigma)_a$ is a constant invariant tensor, vice versa.

3.2.3 Constant invariant tensors $(\sigma, i\varsigma)^a{}_{A_\varsigma A'_\varsigma}, (\sigma, -i\varsigma)_a{}^{A'_\varsigma A_\varsigma}$ [1, 2]

Cor. 3.2.1. $(\sigma, i\varsigma)^a = [e^{(i\omega\cdot R+\epsilon\cdot L)}]^a{}_b e^{(i\omega+\varsigma\epsilon)\cdot\frac{1}{2}\sigma}(\sigma, i\varsigma)^b e^{-(i\omega-\varsigma\epsilon)\cdot\frac{1}{2}\sigma}$*; $(\sigma, i\varsigma)^a{}_{A_\varsigma A'_\varsigma}$ are constant invariant tensors.*

Cor. 3.2.2. $(\sigma, -i\varsigma)_a = [e^{(i\omega\cdot R+\epsilon\cdot L)}]_a{}^b e^{(i\omega-\varsigma\epsilon)\cdot\frac{1}{2}\sigma}(\sigma, -i\varsigma)_b e^{-(i\omega+\varsigma\epsilon)\cdot\frac{1}{2}\sigma}$*; $(\sigma, -i\varsigma)_a{}^{A'_\varsigma A_\varsigma}$ are constant invariant tensors.*

Self comment: This pair of constant invariant tensors is the protagonist of Penrose's spin analysis [1, 2]. This is also one of the reasons that inspired me to develop the theory of general constant invariant tensors. I'm just rediscovering it in my way here.

3.2.4 Generalization of fundamental theorem 1

The following theorem exists in any N+1 dimensional space-time.(Finally to be generalized successfully.)

Thm. 3.2.2. $[\Gamma, i\varsigma]^a = [e^{\vartheta}]^a{}_b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i,\Gamma_j]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma}[\Gamma, i\varsigma]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i,\Gamma_j]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma} \Leftrightarrow \{\Gamma_i, \Gamma_j\} = 2\delta_{ij}; S_{ij} := -\frac{i}{4}[\Gamma_i, \Gamma_j]$

Proof: $[\Gamma, i\varsigma]^a = [e^{\vartheta}]^a{}_b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i,\Gamma_j]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma}[\Gamma, i\varsigma]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i,\Gamma_j]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma}$
$\Leftrightarrow [\Gamma, i\varsigma]^a = [e^{\vartheta}]^a{}_b e^{\frac{i}{2}\vartheta^{ij}S_{ij}+\varsigma\epsilon\cdot\frac{1}{2}\Gamma}[\Gamma, i\varsigma]^b e^{-\frac{i}{2}\vartheta^{ij}S_{ij}+\varsigma\epsilon\cdot\frac{1}{2}\Gamma}$
$\Leftrightarrow [\Gamma, i\varsigma]^a = (\delta^a{}_b + \vartheta^a{}_b)$
$[1 + \frac{i}{2}\vartheta^{ij}S_{ij} + \varsigma\epsilon\cdot\frac{1}{2}\Gamma][\Gamma, i\varsigma]^b[1 - \frac{i}{2}\vartheta^{ij}S_{ij} + \varsigma\epsilon\cdot\frac{1}{2}\Gamma]$
$\Leftrightarrow 0 = \vartheta^a{}_b[\Gamma, i\varsigma]^b$
$+ [\frac{i}{2}\vartheta^{ij}S_{ij} + \varsigma\epsilon\cdot\frac{1}{2}\Gamma][\Gamma, i\varsigma]^a + [\Gamma, i\varsigma]^a[-\frac{i}{2}\vartheta^{ij}S_{ij} + \varsigma\epsilon\cdot\frac{1}{2}\Gamma]$
$\Leftrightarrow 0 = \vartheta^a{}_b[\Gamma, i\varsigma]^b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\varsigma]^a] + \frac{1}{2}\varsigma\{[\Gamma, i\varsigma]^a, \epsilon\cdot\Gamma\}$
$\Leftrightarrow 0 = \vartheta^{ab}[\Gamma, i\varsigma]_b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\varsigma]^a] + \frac{1}{2}\varsigma\{[\Gamma, i\varsigma]^a, \epsilon\cdot\Gamma\}$
$\Leftrightarrow \begin{cases}0 = \vartheta^{kb}[\Gamma, i\varsigma]_b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\varsigma]^k] + \frac{1}{2}\varsigma\{[\Gamma, i\varsigma]^k, \epsilon\cdot\Gamma\} \\ 0 = \vartheta^{\pi b}[\Gamma, i\varsigma]_b + \frac{i}{2}\vartheta^{ij}[S_{ij}, [\Gamma, i\varsigma]^\pi] + \frac{1}{2}\varsigma\{i\varsigma, \epsilon\cdot\Gamma\}\end{cases}$
$\Leftrightarrow \begin{cases}0 = \vartheta^{kj}\Gamma_j + i\varsigma\vartheta^{k\pi} + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\varsigma\epsilon_l\{\Gamma^k, \Gamma^l\} \\ 0 = \vartheta^{\pi j}\Gamma_j + i\epsilon\cdot\Gamma\end{cases}$
$\Leftrightarrow \begin{cases}0 = \vartheta^{kj}\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\varsigma\epsilon_l\{\Gamma^k, \Gamma^l\} - \varsigma\epsilon^k \\ 0 = 0\end{cases}$
$\Leftrightarrow 0 = \vartheta^{ij}\delta^k{}_i\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k] + \frac{1}{2}\varsigma\epsilon_l\{\Gamma^k, \Gamma^l\} - \varsigma\epsilon^k$
$\Leftrightarrow \begin{cases}0 = \frac{1}{2}\varsigma\epsilon_l\{\Gamma^k, \Gamma^l\} - \varsigma\epsilon^k \\ 0 = \vartheta^{ij}\delta^k{}_i\Gamma_j + \frac{i}{2}\vartheta^{ij}[S_{ij}, \Gamma^k]\end{cases}$
$\Leftrightarrow \begin{cases}0 = \frac{1}{2}\varsigma\epsilon_l\{\Gamma^k, \Gamma^l\} - \varsigma\epsilon^k \\ 0 = \vartheta^{ij}\{\frac{1}{2}\delta_{k[i}\Gamma_{j]} + \frac{i}{2}[S_{ij}, \Gamma_k]\}\end{cases}$
$\Leftrightarrow \begin{cases}\{\Gamma_i, \Gamma_j\} = 2\delta_{ij} \\ i[\Gamma_k, S_{ij}] = \delta_{k[i}\Gamma_{j]}\end{cases}$
$\Leftrightarrow \{\Gamma_i, \Gamma_j\} = 2\delta_{ij}$ □

The above theorem indicates: The anti commutative relation $\{\Gamma_i, \Gamma_j\} = 2\delta_{ij}$ means that $(\Gamma, i\varsigma)_a$ is a constant invariant tensor, vice versa. The fundamental theorem 1 is just a special case.

3.2.5 Constant invariant tensors $[\Gamma(N), i\varsigma]^a_{A_\varsigma A'_\varsigma}, [\Gamma(N), -i\varsigma]_a^{A'_\varsigma A_\varsigma}$

Cor. 3.2.3.
$\{\Gamma_i(N), \Gamma_j(N)\} = 2\delta_{ij} \Rightarrow [\Gamma(N), i\varsigma]^a = [e^{\vartheta}]^a{}_b e^{\frac{1}{8}\vartheta^{ij}[\Gamma_i(N),\Gamma_j(N)]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma(N)}[\Gamma(N), i\varsigma]^b e^{-\frac{1}{8}\vartheta^{ij}[\Gamma_i(N),\Gamma_j(N)]+\varsigma\epsilon\cdot\frac{1}{2}\Gamma(N)}$

Self comment: Therefore $[\Gamma(N), i\varsigma]^a_{A_\varsigma A'_\varsigma}$ and $[\Gamma(N), -i\varsigma]_a^{A'_\varsigma A_\varsigma}$ are constant invariant tensors. It is a generalization of Penrose spinors in high and low dimensional space-time.

3.3 Fundamental theorem 2 and its relevant constant invariant tensors

$\Leftrightarrow [\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}] = i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\Gamma_{\gamma_\varsigma}$ □

The above theorem indicates: The commutative relation $[\Gamma_{\alpha_\varsigma}, \Gamma_{\beta_\varsigma}] = i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\Gamma_{\gamma_\varsigma}$ means that $\Gamma_{\alpha_\varsigma}$ a constant invariant tensor, vice versa.

$\Leftrightarrow 0=\theta^\gamma(f_{\gamma\alpha}{}^\beta T_\beta+i[T_\gamma,T_\alpha]),\forall\theta^\gamma\to0$
$\Leftrightarrow 0=f_{\gamma\alpha}{}^\beta T_\beta+i[T_\gamma,T_\alpha]$
$\Leftrightarrow[T_\alpha,T_\beta]=if_{\alpha\beta}{}^\gamma T_\gamma$ □

The above theorem indicates: The commutative relation $[T_\alpha,T_\beta]=if_{\alpha\beta}{}^\gamma T_\gamma$ means that Yang-Mills basis T_α is a constant invariant tensor, vice versa. And fundamental theorem 2 is a special case of this theorem. ($f_{\alpha\beta}{}^\gamma=\varepsilon_{\alpha\beta}{}^\gamma,i\theta^\gamma=i\omega+\varsigma\epsilon,T_\alpha=\Gamma_\alpha$). This theorem is more general and can describe the covariance of internal and external spaces. And there is no requirement for the linear independence of T_α. If T_α satisfies linear independence, it can be seen from the group structure equation that the group structure constant $f_{\alpha\beta}{}^\gamma$ also satisfies a commutative relation similar to the Yang-Mills basis $f_{\alpha\beta}{}^\gamma$. That is, there is the following inference.

Cor. 3.6.1. $[-if_\alpha,-if_\beta]=if_{\alpha\beta}{}^\gamma(-if_\gamma)\Leftrightarrow-if_\alpha=[e^{\theta^\gamma f_\gamma}]_\alpha{}^\beta e^{i\theta^\gamma(-if_\gamma)}(-if_\beta)e^{-i\theta^\gamma(-if_\gamma)}$

The left side of the above equation is the structural equation of the group. So if the basis T_α satisfies linear independence, then the group structure constant $f_{\alpha\beta}{}^\gamma$ is a constant invariant tensor too.
Self comment: The above shows that the Yang-Mills basis and group structure constant are constant invariant tensors of the internal space.

3.7 Fundamental theorem 6 and its relevant constant invariant tensors

3.7.1 Fundamental theorem 6

Thm. 3.7.1. $\Gamma=e^{(i\omega\cdot R+\varsigma\epsilon\cdot L)}\Gamma e^{-(i\omega\cdot R-\varsigma\epsilon\cdot L)}\Leftrightarrow[R,\Gamma]=0,\{L,\Gamma\}=0$

Proof: $\Gamma=e^{(i\omega\cdot R+\varsigma\epsilon\cdot L)}\Gamma e^{-(i\omega\cdot R-\varsigma\epsilon\cdot L)},\forall\omega,\forall\epsilon$
$\Leftrightarrow\Gamma=[1+(i\omega\cdot R+\varsigma\epsilon\cdot L)]\Gamma[1-(i\omega\cdot R-\varsigma\epsilon\cdot L)],\forall\omega\to0,\forall\epsilon\to0$
$\Leftrightarrow 0=(i\omega\cdot R+\varsigma\epsilon\cdot L)]\Gamma-\Gamma(i\omega\cdot R-\varsigma\epsilon\cdot L),\forall\omega\to0,\forall\epsilon\to0$
$\Leftrightarrow 0=i\omega\cdot[R,\Gamma]+\varsigma\epsilon\cdot\{L,\Gamma\},\forall\omega\to0,\forall\epsilon\to0$
$\Leftrightarrow[R,\Gamma]=0,\{L,\Gamma\}=0$ □

Cor. 3.7.1. $\eta=e^{(i\omega\cdot R+\varsigma\epsilon\cdot L)}\eta e^{-(i\omega\cdot R-\varsigma\epsilon\cdot L)},\eta=diag(1,1,1,-1)$; $\eta^{a_\varsigma}{}_{b'_\varsigma},\eta^a{}_{b'},\eta^{a'}{}_b,\eta^{ab'},\eta^{a'b}$ *are constant invariant tensors.*

Self comment: This constant invariant tensor can complete the mutual conversion between vectors and prime vectors. The form is the same as the Minskoff metric.

3.8 Various methods for obtaining new constant invariant tensors

Method 1: $\epsilon \leftrightarrow -\epsilon$
Method 2: $\varsigma \leftrightarrow -\varsigma$
Method 3: Matrix operations such as complex conjugation, transposition, similarity transformation and representation transformation.
Method 4: Operations such as direct product, direct sum, contraction, addition, subtraction, multiplication, and division.
In addition, the above methods have been used in various corollaries of the six basic theorems to obtain various constant invariant tensors. The proof of various corollaries is basically obvious, and the proof process is mostly omitted for the sake of compactness of the content.

3.9 Reviews on six fundamental theorems

Mathematical proof of six fundamental theorems for transformation parameters $\omega, \epsilon, \vartheta^{ab}, \theta^{\alpha}$ are no special restrictions and can take any complex number. Therefore, the constant invariant tensors obtained have great mathematical universality. However, for specific physics, various parameters of the internal gauge transformation can still take complex numbers. However, for external spatiotemporal transformations, due to physical self consistency requirements, the transformation must satisfy the Lorentz group representation [12]. Therefore, there are restrictions on the transform matrix and transformation parameters, and ω, ϵ can only take real numbers. In particular, it should be pointed out that the generalized form of Fundamental Theorem 1, Fundamental Theorem 3, and Fundamental Theorem 4 not only hold true in four-dimensional space-time, but also in any N+1-dimensional space-time. This provides a mathematical analysis tool for the physical study of high and low dimensional space-time. The following enlightenment can also be obtained from the proof of the six basic theorems: The commutative and anti commutative relations of matrices imply the existence of corresponding constant invariant tensor. Conversely, a constant invariant tensor implies the existence of corresponding commutative or anti commutative relations. Starting from this idea, we can find more meaningful constant invariant tensors. It can also be seen from the above that the commutative and anti commutative relations of matrices imply their own covariance. That is, the commutative and anti commutative relations of the matrix imply that it holds true in any reference system. This is a very interesting and wonderful bootstrap mathematical property, that is memorable.

4 Properties of several intuitive basic constant invariant tensors

4.1 Properties of basic constant invariant tensors $\varepsilon^{A_\varsigma B_\varsigma}, \varepsilon_{A_\varsigma B_\varsigma}, \varepsilon^{A'_\varsigma B'_\varsigma}, \varepsilon_{A'_\varsigma B'_\varsigma}$ [1,2]

4.1.1 Important properties

$$\varepsilon^{A_\varsigma B_\varsigma}\varepsilon_{C_\varsigma D_\varsigma} = \delta^{[A_\varsigma}_{C_\varsigma}\delta^{B_\varsigma]}_{D_\varsigma} = \delta^{A_\varsigma}_{[C_\varsigma}\delta^{B_\varsigma}_{D_\varsigma]} \qquad \varepsilon_{A'_\varsigma B'_\varsigma}\varepsilon^{C'_\varsigma D'_\varsigma} = \delta^{C'_\varsigma}_{[A'_\varsigma}\delta^{D'_\varsigma}_{B'_\varsigma]} = \delta^{[C'_\varsigma}_{A'_\varsigma}\delta^{D'_\varsigma]}_{B'_\varsigma} \tag{1.52}$$

Comparison: $S_{abcd} = \delta_{ac}\delta_{bd} - \delta_{ad}\delta_{bc}, S_{ab}{}^{cd} = \delta^{[c}_{a}\delta^{d]}_{b}$ (1.53)

$$\varepsilon_{A_\varsigma B_\varsigma}\varepsilon_{C_\varsigma D_\varsigma} = \varepsilon_{A_\varsigma C_\varsigma}\varepsilon_{B_\varsigma D_\varsigma} - \varepsilon_{A_\varsigma D_\varsigma}\varepsilon_{B_\varsigma C_\varsigma} \qquad \varepsilon_{A'_\varsigma B'_\varsigma}\varepsilon_{C'_\varsigma D'_\varsigma} = \varepsilon_{A'_\varsigma C'_\varsigma}\varepsilon_{B'_\varsigma D'_\varsigma} - \varepsilon_{A'_\varsigma D'_\varsigma}\varepsilon_{B'_\varsigma C'_\varsigma} \tag{1.54}$$

$$\varepsilon^{A_\varsigma B_\varsigma}\varepsilon^{C_\varsigma D_\varsigma} = \varepsilon^{A_\varsigma C_\varsigma}\varepsilon^{B_\varsigma D_\varsigma} - \varepsilon^{A_\varsigma D_\varsigma}\varepsilon^{B_\varsigma C_\varsigma} \qquad \varepsilon^{A'_\varsigma B'_\varsigma}\varepsilon^{C'_\varsigma D'_\varsigma} = \varepsilon^{A'_\varsigma C'_\varsigma}\varepsilon^{B'_\varsigma D'_\varsigma} - \varepsilon^{A'_\varsigma D'_\varsigma}\varepsilon^{B'_\varsigma C'_\varsigma} \tag{1.55}$$

$$\varepsilon_{A_\varsigma B_\varsigma}\varepsilon_{C_\varsigma D_\varsigma} + \varepsilon_{A_\varsigma C_\varsigma}\varepsilon_{D_\varsigma B_\varsigma} + \varepsilon_{A_\varsigma D_\varsigma}\varepsilon_{B_\varsigma C_\varsigma} = 0 \qquad \varepsilon_{A_\varsigma[B_\varsigma}\varepsilon_{C_\varsigma D_\varsigma]} = 0 \tag{1.56}$$

$$\varepsilon_{A_\varsigma}{}^{B_\varsigma} = \delta_{A_\varsigma}{}^{B_\varsigma} = -\varepsilon^{B_\varsigma}{}_{A_\varsigma} \qquad \varepsilon^{A'_\varsigma}{}_{B'_\varsigma} = \delta^{A'_\varsigma}{}_{B'_\varsigma} = -\varepsilon_{B'_\varsigma}{}^{A'_\varsigma} \tag{1.57}$$

4.1.2 Complex conjugation

$$[\varepsilon^{A_\varsigma B_\varsigma}]^* = \varepsilon^{A'_\varsigma B'_\varsigma} \qquad [\varepsilon_{A_\varsigma B_\varsigma}]^* = \varepsilon_{A'_\varsigma B'_\varsigma} \tag{1.58}$$

4.2 Properties of basic constant invariant tensors $(\sigma, -i\varsigma)_a^{A'_\varsigma A_\varsigma}, (\sigma, i\varsigma)^a_{A_\varsigma A'_\varsigma}$ [1,2]

4.2.1 Transformability

Transformability

$$\frac{i\varsigma}{\sqrt{2}}(\sigma, -i\varsigma)_a^{A'_\varsigma A_\varsigma} = [\varsigma\varepsilon^{A_\varsigma B_\varsigma}][\varsigma\varepsilon^{A'_\varsigma B'_\varsigma}]\frac{-i\varsigma}{\sqrt{2}}(\sigma, i\varsigma)_{aB_\varsigma B'_\varsigma} \tag{1.59}$$

$$\frac{-i\varsigma}{\sqrt{2}}(\sigma, i\varsigma)^a_{A_\varsigma A'_\varsigma} = [-\varsigma\varepsilon_{A'_\varsigma B'_\varsigma}][-\varsigma\varepsilon_{A_\varsigma B_\varsigma}]\frac{i\varsigma}{\sqrt{2}}(\sigma, -i\varsigma)^{aB'_\varsigma B_\varsigma} \tag{1.60}$$

$$\frac{(-i\varsigma)}{\sqrt{2}}[\sigma, -i(-\varsigma)]_a^{A'_{-\varsigma}A_{-\varsigma}} \simeq \frac{-i\varsigma}{\sqrt{2}}(\sigma, i\varsigma)^a_{A_\varsigma A'_\varsigma} \tag{1.61}$$

Non redundant version: $\frac{i}{\sqrt{2}}(\sigma, -i)_a^{A'A}, \frac{i}{\sqrt{2}}(-\sigma, -i)^a_{AA'}$
The above shows that the two constant invariant tensors are not independent, and there is only one truly independent tensor.

6.8 Properties of composite constant invariant tensor $\Sigma^{k_s l_s}_{k_{s'} l_{s'}}(s, s')$

6.8.1 Definition

$$c(s) = [(-1)^{2s}\tfrac{8}{3}s(s + \tfrac{1}{2})(s + 1)]^{-\frac{1}{2}} \tag{1.291}$$

$$\Sigma^{k_s l_s}_{ab}(s) := \begin{cases} c(|s|)S_{ab}{}^{kl}(|s|, +), s > 0 \\ c(|s|)S_{abk'l'}(|s|, -), s < 0 \end{cases} \qquad \Sigma^{ab}_{k_s l_s}(s) := \begin{cases} c(|s|)S^{ab}{}_{kl}(|s|, +), s > 0 \\ c(|s|)S^{abk'l'}(|s|, -), s < 0 \end{cases} \tag{1.292}$$

: $\Sigma^{k_s l_s}_{k_{s'} l_{s'}}(s, s') := \Sigma^{k_s l_s}_{ab}(s)\Sigma^{ab}_{k_{s'} l_{s'}}(s')$ (1.293)

6.8.2 Transitivity

$$\Sigma^{k_s l_s}_{k_{s'} l_{s'}}(s, s')\Sigma^{k_{s'} l_{s'}}_{k_{s''} l_{s''}}(s', s'') = \Sigma^{k_s l_s}_{k_{s''} l_{s''}}(s, s'') \tag{1.294}$$

6.8.3 Symmetry and antisymmetry

$$\Sigma^{k_s l_s}_{k_{s'} l_{s'}}(s, s') = (-1)^{2s+1}\Sigma^{l_s k_s}_{k_{s'} l_{s'}}(s, s') \qquad \Sigma^{l_s k_s}_{k_{s'} l_{s'}}(s, s') = (-1)^{2s'+1}\Sigma^{k_s l_s}_{l_{s'} k_{s'}}(s, s') \tag{1.295}$$

$$\Sigma^{k_s l_s}_{k_{s'} l_{s'}}(s, s') = (-1)^{2(s+s')}\Sigma^{l_s k_s}_{l_{s'} k_{s'}}(s, s') \tag{1.296}$$

7 General theory of constant invariant tensors

7.1 General definition of constant invariant tensors

Define the Lorentz transformation: $\Lambda[L_i] := e^{\frac{i}{2}\vartheta^{ab}S_{ab}[L_i]}$, (1.297)

Define the YM field transformation: $\Lambda[Y_j] := e^{i\theta^\alpha T_\alpha[Y_j]}$ (1.298)

General definition of constant invariant tensors:

$C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n}$ **is constant and equal in any reference system and satisfies the transformation:**

$$C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n} = \prod_{i=1}^{n} \Lambda^{L_i'}_{L_i}[L_i] \prod_{j=1}^{m} \Lambda^{Y_j}_{Y_j'}[Y_j] C^{Y_1'Y_2'\cdots Y_m'}_{L_1'L_2'\cdots L_n'} \tag{1.299}$$

Then $C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n}$ **is a constant invariant tensor.** $L_i \sim e^{\frac{i}{2}\vartheta^{ab}S_{ab}[L_i]}, Y_j \sim e^{i\theta^\alpha T_\alpha[Y_j]}$

Infinitesimal transformation:

$$0 = \delta C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n} = \tfrac{1}{2}\vartheta^{ab}\sum_{i=1}^{n} S_{ab}{}^{L_i'}_{L_i}[L_i] C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_i'\cdots L_n} + i\theta^\alpha \sum_{j=1}^{m} T_\alpha{}^{Y_j}_{Y_j'}[L_i] C^{Y_1Y_2\cdots Y_j'\cdots Y_m}_{L_1L_2\cdots L_n}, \forall\vartheta^{ab}, \forall\theta^\alpha \tag{1.300}$$

$$\Leftrightarrow \sum_{i=1}^{n} S_{ab}{}^{L_i'}_{L_i}[L_i] C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_i'\cdots L_n} = 0, \sum_{j=1}^{m} T_\alpha{}^{Y_j}_{Y_j'}[L_i] C^{Y_1Y_2\cdots Y_j'\cdots Y_m}_{L_1L_2\cdots L_n} = 0 \tag{1.301}$$

7.2 Covariant derivatives of constant invariant tensors are zero

$$D_u C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n} = \partial_u C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n} + \tfrac{1}{2}\omega_u{}^{ab}\sum_{i=1}^{n} S_{ab}{}^{L_i'}_{L_i}[L_i] C^{Y_1Y_2\cdots Y_m}_{L_1\cdots L_i'\cdots L_n} + iA_u{}^\alpha \sum_{j=1}^{m} T_\alpha{}^{Y_j}_{Y_j'}[L_i] C^{Y_1\cdots Y_j'\cdots Y_m}_{L_1L_2\cdots L_n} \tag{1.302}$$

$$D_u C^{Y_1Y_2\cdots Y_m}_{L_1L_2\cdots L_n} = 0 + 0 + 0 = 0 \tag{1.303}$$

Therefore, the covariant derivatives of all constant invariant tensors are all zero, which is a very good and convenient property.

Chapter2 Perfect Constant Invariant Tensors

Self comment: The perfect constant invariant tensors created in this chapter have great universality and can be applicable to various situations. It associates a fully symmetric low spin tensor with a high spin tensor. It is a powerful mathematical tool for studying general spin particles. Inspired by the fully antisymmetric tensor, I tried to find a similar fully symmetric tensor. After constant attempts, I finally found such a fully symmetric spin tensor. Then by combining with various basic constant invariant tensors obtained in the previous chapter, several useful special constant invariant tensors have been further developed.

1 Permutation of symmetric indices

Self comment: Unlike the previous sorting starts counting from 1, this section starts counting from 0. This is more natural and naturally matches the w+1 radix.

Def. 1.0.1. $\sigma \otimes I = I \bar{\otimes} \sigma = \begin{bmatrix} \sigma & 0 \\ 0 & \sigma \end{bmatrix}$

1.1 Permutation of second-order symmetric indices

1.1.1 Permutation of second-order symmetric indices $A \bar{\otimes} B \bar{\otimes} C \bar{\otimes} D$

Cor. 1.1.1.

$$\begin{cases} \begin{bmatrix} 0\ 0\ 0\ 0 \\ 0\ 0\ 0\ 1 \end{bmatrix} \\ \begin{bmatrix} [0\ 0\ 1\ 0] \\ 0\ 0\ 1\ 1 \end{bmatrix} \end{cases} \quad \begin{cases} \begin{bmatrix} [0\ 1\ 0\ 0] \\ [0\ 1\ 0\ 1] \end{bmatrix} \\ \begin{bmatrix} [0\ 1\ 1\ 0] \\ 0\ 1\ 1\ 1 \end{bmatrix} \end{cases} \quad \begin{cases} \begin{bmatrix} [1\ 0\ 0\ 0] \\ [1\ 0\ 0\ 1] \end{bmatrix} \\ \begin{bmatrix} [1\ 0\ 1\ 0] \\ [1\ 0\ 1\ 1] \end{bmatrix} \end{cases} \quad \begin{cases} \begin{bmatrix} [1\ 1\ 0\ 0] \\ [1\ 1\ 0\ 1] \end{bmatrix} \\ \begin{bmatrix} [1\ 1\ 1\ 0] \\ 1\ 1\ 1\ 1 \end{bmatrix} \end{cases}$$

1.1.2 Deduction of permutation law for second-order symmetric indices $A \leq B \leq C \leq D$

Cor. 1.1.2.

$$\begin{cases} c_3 = 0 \\ c_2 = a_2 = 2 \\ c_1 = a_2 + a_1 = 2 + 1 \\ c_n = C_3^2 - C_n^2 \end{cases} \quad \begin{cases} d_0 = c_3 = 0 \\ d_1 = c_2 = 2 \\ d_2 = c_1 = 3 \\ d_n = C_3^2 - C_{3-n}^2 \end{cases}$$

$$\begin{cases} A_0 d_0 = 0 \\ A_0 d_1 = 2 \\ A_0 d_2 = 3 \\ A_0 d_n = (C_3^2 - C_{3-n}^2) u(C_3^2 - C_{5-3}^2) \end{cases} \quad \begin{cases} A_1 d_0 = 0 + C_3^2 \\ A_1 d_1 = 0 + C_3^2 \\ A_1 d_2 = 1 + C_3^2 \\ A_1 d_n = (C_2^2 - C_{3-n}^2) u(C_2^2 - C_{3-n}^2) + C_3^2 \end{cases}$$

1.1.3 A summary of forward permutation rules for second-order symmetric indices

Cor. 1.1.3.

$$k_{0 \leq 0 \leq \eta \leq \xi} = (C_3^2 - C_{3-\eta}^2) + (\sum_{k=\eta}^{\xi} C_{1-k}^0 - C_{1-\lambda_0}^0)$$

$$k_{0 \leq \mu \leq \eta \leq \xi} = (\sum_{k=0}^{\mu} C_{3-k}^2 - C_{3-\eta}^2) + (\sum_{k=\eta}^{\xi} C_{1-k}^0 - C_{1-\lambda_0}^0)$$

$$k_{\lambda \leq \mu \leq \eta \leq \xi} = (C_5^4 - C_{5-\lambda}^4) + (\sum_{k=\lambda}^{\mu} C_{3-k}^2 - C_{3-\eta}^2) + (\sum_{k=\eta}^{\xi} C_{1-k}^0 - C_{1-\lambda_0}^0)$$

$$k_{d \leq \lambda \leq \mu \leq \eta \leq \xi} = (\sum_{k=0}^{d} C_{5-k}^4 - C_{5-\lambda}^4) + (\sum_{k=\lambda}^{\mu} C_{3-k}^2 - C_{3-\eta}^2) + (\sum_{k=\eta}^{\xi} C_{1-k}^0 - C_{1-\lambda_0}^0)$$

1.1.4 General conjecture of forward permutation rules for second-order symmetric indices

Ass. 1.1.1.

$$k_{\lambda_{2s} \cdots \leq \lambda_4 \leq \lambda_3 \leq \lambda_2 \leq \lambda_1} = \sum_{l=0}^{[s]} (\sum_{k=\lambda_{2l+2}}^{\lambda_{2l+1}} C_{2l+1-k}^{2l} - C_{2l+1-\lambda_{2l}}^{2l}); \lambda_i = 0, i > 2s | i = 0; \lambda_i = (0,1), 1 \leq i \leq 2s$$

1.2 Permutation of fourth-order symmetric indices

3.15 Another proof of two theorems

Thm. 3.15.1. $\Omega(s)\Gamma(s)=\Gamma(s)\sigma(s),\bar{\Gamma}(s)\Omega(s)=\sigma(s)\bar{\Gamma}(s)$

Proof: Taking mathematical methods of induction.
1: When $s=\frac{1}{2},\sigma(\frac{1}{2})\Gamma(\frac{1}{2})=\Gamma(\frac{1}{2})\sigma(\frac{1}{2})$ establishes.
2: Assume: when $s=k,\Omega(k)\Gamma(k)=\Gamma(k)\sigma(k)$ establishes.
3: When $s=k+\frac{1}{2}$,
$\Omega(k+\frac{1}{2})\Gamma(k+\frac{1}{2})$
$=[\sigma(\frac{1}{2})\otimes I_{2^{2k}}+I\otimes\Omega(k)][I\otimes\Gamma(k)]N(k+\frac{1}{2})$
$=\{[I\otimes\Gamma(k)][\sigma(\frac{1}{2})\otimes I_{2(k+1)}]+I\otimes[\Gamma(k)\sigma(k)]\}N(k+\frac{1}{2})$
$=[I\otimes\Gamma(k)][\sigma(\frac{1}{2})\otimes I_{2(k+1)}+I\otimes\sigma(k)]N(k+\frac{1}{2})$
$=[I\otimes\Gamma(k)]N(k+\frac{1}{2})\sigma(k+\frac{1}{2})$
$=\Gamma(k+\frac{1}{2})\sigma(k+\frac{1}{2})$
4: So the proposition establishes and has been proved. □

Chapter3 Important Composite Constant Invariant Tensors

Self comment: This chapter conducts an in-depth analysis of multiple complex constant invariant tensors and obtains some very useful conclusions. It is a powerful mathematical tool for studying high spin particles.

1.7 Linear algebraic method for solving expansion coefficients

The linear algebraic solution in this section embodies the holographic principle of mathematics. By solving only one projection direction, the solution of the entire space can be obtained. That is, one projection direction contains the information of the entire space, reflecting the holographic principle.

6 The most basic constant invariant tensors

The most basic constant invariant tensors:

$$\varepsilon_{AB},\varepsilon^{AB};\delta_{ab},\delta^{ab};\delta_{\alpha\beta},\delta^{\alpha\beta};\varepsilon_{\alpha\beta\gamma};(\sigma,-i)_a^{A'A};\sigma^{\alpha}{}_{A}{}^{B};N_{Al}^{k}(s),N_k^{Al}(s) \tag{3.8}$$

The above are the most basic constant invariant tensors. All constant invariant tensors in this chapter and the previous chapters can be derived from them. Therefore, as long as the covariance of the above constant invariant tensors is proved, the covariance of the constant invariant tensors derived from them naturally holds.

Chapter4 Preliminary Study on High Dimensional Constant Invariant Tensor

Self comment: Based on the previous chapters, this chapter comprehensively and systematically develops constant invariant tensors towards higher order and even infinite order, high and low dimensional space-time. Various constant invariant tensors in high and low dimensional space-time are obtained, which provides a powerful mathematical tool for studying particle physics in high and low dimensional space-time.

2 External spatiotemporal symmetry transformation [25, 26]

2.1 Poincare transformation

Cor. 2.1.1. $x' = e^{\varepsilon}x + \theta \Leftrightarrow x' = e^{-\frac{i}{2}\varepsilon^{ab}L_{ab}+i\theta^a p_a}x, L_{ab} = -i(x_a\partial_b - x_b\partial_a), p_a = -i\partial_a$

Proof: $x' = e^{\varepsilon}x + \theta$
$\Leftrightarrow x'_a = x_a + \varepsilon_{ab}x^b + \theta_a$
$\Leftrightarrow x'_a = [1 - \frac{1}{2}\varepsilon^{bc}(x_b\partial_c - x_c\partial_b) + \theta^b\partial_b]x_a$
$\Leftrightarrow x' = [1 - \frac{1}{2}\varepsilon^{ab}(x_a\partial_b - x_b\partial_a) + \theta^a\partial_a]x$
$\Leftrightarrow x' = [1 - \frac{i}{2}\varepsilon^{ab}(x_a p_b - x_b p_a) + i\theta^a p_a]x, p_a = -i\partial_a$
$\Leftrightarrow x' = (1 - \frac{i}{2}\varepsilon^{ab}L_{ab} + i\theta^a p_a)x, L_{ab} := -i(x_a\partial_b - x_b\partial_a)$
$\Leftrightarrow x' = e^{-\frac{i}{2}\varepsilon^{ab}L_{ab}+i\theta^a p_a}x$ □

Cor. 2.1.2. $e^{-\frac{i}{2}\varepsilon^{ab}L_{ab}+i\theta^a p_a}x = e^{\varepsilon}x + \theta$

The Poincare transformation contains two meanings. One is a conventional and intuitive meaning, and the other is a meaning that includes a part of Poincare generators. Actually, it's just like thinking of transformations as operators. It's not easy to think of.

2.2 Lorentz transformation

Cor. 2.2.1. $x' = e^{\varepsilon}x \Leftrightarrow x' = e^{-\frac{i}{2}\varepsilon^{ab}L_{ab}}x, L_{ab} = -i(x_a\partial_b - x_b\partial_a)$

Cor. 2.2.2. $\varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\varphi(e^{-\varepsilon}x) \Leftrightarrow \varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x), M_{ab} = L_{ab} - iS_{ab}$

Proof: $\varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\varphi(e^{-\varepsilon}x)$
$\Leftrightarrow \varphi'(x) = (1 + \frac{i}{2}\varepsilon^{ab}S_{ab})\varphi((1-\varepsilon)x)$
$\Leftrightarrow \varphi'(x) = (1 + \frac{i}{2}\varepsilon^{ab}S_{ab})[\varphi(x) + \frac{1}{2}\varepsilon^{ab}(x_a\partial_b - x_b\partial_a)\varphi(x)]$
$\Leftrightarrow \varphi'(x) = \varphi(x) + \frac{i}{2}\varepsilon^{ab}[-i(x_a\partial_b - x_b\partial_a) + S_{ab}]\varphi(x)$
$\Leftrightarrow \delta\varphi(x) = \frac{i}{2}\varepsilon^{ab}[-i(x_a\partial_b - x_b\partial_a) + S_{ab}]\varphi(x)$
$\Leftrightarrow \varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}[-i(x_a\partial_b - x_b\partial_a)+S_{ab}]}\varphi(x)$
$\Leftrightarrow \varphi'(x) = e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x), M_{ab} = L_{ab} + S_{ab}$ □

Cor. 2.2.3. $e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\varphi(e^{-\varepsilon}x)$

Cor. 2.2.4. $x = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}(e^{-\varepsilon}x) \Leftrightarrow x = e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}x$

The Lorentz group generator is implicit in the state transformation and coordinate identity transformation: M_{ab}The meaning of a generator is that the independent variable remains unchanged and the function changes. It is an operator.

2.3 Translational transformation

Cor. 2.3.1. $\varphi'(x) = \varphi(x+\theta) \Leftrightarrow \varphi'(x) = e^{\theta^a\partial_a}\varphi(x) \Leftrightarrow \varphi'(x) = e^{i\theta^a p_a}\varphi(x)$

Cor. 2.3.2. $e^{i\theta^a p_a}\varphi(x) = \varphi(x+\theta)$

The translation generator is implicit in a simple shift transformation: p_a and its operator transformation.

2.4 Commutative relations of Poincare groups generators

Commutative relations of Poincare group generator M_{ab}, p_a:

$$M_{ab} = L_{ab} + S_{ab}, L_{ab} = x_a p_b - x_b p_a, g_{ab} = \delta_{ab} \tag{4.1}$$

$$\begin{cases} i[M_{ab}, M_{cd}] = g_{ad}M_{bc} - g_{ac}M_{bd} + g_{bc}M_{ad} - g_{bd}M_{ac} \\ i[M_{ab}, p_c] = g_{bc}p_a - g_{ac}p_b, [p_a, p_b] = 0 \end{cases} \tag{4.2}$$

Commutative relations of Poincare group generator L_{ab}, S_{ab}, p_a:

$$\begin{cases} L_{ab}, L_{cd}] = g_{ad}L_{bc} - g_{ac}L_{bd} + g_{bc}L_{ad} - g_{bd}L_{ac} \\ i[L_{ab}, p_c] = g_{bc}p_a - g_{ac}p_b, [p_a, p_b] = 0 \end{cases} \tag{4.3}$$

$$i[S_{ab}, S_{cd}] = g_{ad}S_{bc} - g_{ac}S_{bd} + g_{bc}S_{ad} - g_{bd}S_{ac} \tag{4.4}$$

$$[S_{ab}, L_{cd}] = 0, [S_{ab}, p_c] = 0 \tag{4.5}$$

2.5 Meaning of generators

The generators can generate corresponding symmetric transformations. Generators are also generally conserved quantities of the system. Conversely, a conserved quantity is also a generator of the system nd generators also form certain closed algebras.

3.1 Infinite dimensional invariant tensors [25, 26] in the sense of quantum mechanics

Def. 3.1.1. $\hat{M}_{ab} := \hat{L}_{ab} + S_{ab}, \hat{L}_{ab} := x_a\hat{p}_b - x_b\hat{p}_a, \hat{p}_a := -i\partial_a, g_{ab} = \delta_{ab}$

Cor. 3.1.1. $\begin{cases} i[\hat{M}_{ab}, \hat{M}_{cd}] = g_{ad}\hat{M}_{bc} - g_{ac}\hat{M}_{bd} + g_{bc}\hat{M}_{ad} - g_{bd}\hat{M}_{ac} \Leftrightarrow \hat{M}_{ab} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d e^{\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}}\hat{M}_{cd}e^{-\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} \\ i[\hat{L}_{ab}, \hat{L}_{cd}] = g_{ad}\hat{L}_{bc} - g_{ac}\hat{L}_{bd} + g_{bc}\hat{L}_{ad} - g_{bd}\hat{L}_{ac} \Leftrightarrow \hat{L}_{ab} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d e^{\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}}\hat{L}_{cd}e^{-\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} \\ i[S_{ab}, S_{cd}] = g_{ad}S_{bc} - g_{ac}S_{bd} + g_{bc}S_{ad} - g_{bd}S_{ac} \Leftrightarrow S_{ab} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d e^{\frac{i}{2}\vartheta^{ef}S_{ef}}S_{cd}e^{-\frac{i}{2}\vartheta^{ef}S_{ef}} \end{cases}$

Cor. 3.1.2. $\begin{cases} i[\hat{p}_a, \hat{M}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow \hat{p}_a = [e^{\vartheta}]_a{}^b e^{\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}}\hat{p}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} \\ i[\hat{p}_a, \hat{L}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow \hat{p}_a = [e^{\vartheta}]_a{}^b e^{\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}}\hat{p}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} \end{cases}$

From the above, it can be seen that $\hat{M}_{ab}, \hat{p}_a$ are invariant tensors, but obviously not constant tensors. In another equivalent way of writing, Lorentz transformation in relativity can be associated with unitary transformation in quantum mechanics.

Cor. 3.1.3. $\begin{cases} i[\hat{M}_{ab}, \hat{M}_{cd}] = g_{ad}\hat{M}_{bc} - g_{ac}\hat{M}_{bd} + g_{bc}\hat{M}_{ad} - g_{bd}\hat{M}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}}\hat{M}_{ab}e^{\frac{i}{2}\vartheta^{ef}\hat{M}_{ef}} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\hat{M}_{cd} \\ i[\hat{L}_{ab}, \hat{L}_{cd}] = g_{ad}\hat{L}_{bc} - g_{ac}\hat{L}_{bd} + g_{bc}\hat{L}_{ad} - g_{bd}\hat{L}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}}\hat{L}_{ab}e^{\frac{i}{2}\vartheta^{ef}\hat{L}_{ef}} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\hat{L}_{cd} \\ i[S_{ab}, S_{cd}] = g_{ad}S_{bc} - g_{ac}S_{bd} + g_{bc}S_{ad} - g_{bd}S_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}S_{ef}}S_{ab}e^{\frac{i}{2}\vartheta^{ef}S_{ef}} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d S_{cd} \end{cases}$

Cor. 3.1.4. $\begin{cases} i[\hat{p}_a, \hat{M}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}}\hat{p}_a e^{\frac{i}{2}\vartheta^{cd}\hat{M}_{cd}} = [e^{\vartheta}]_a{}^b\hat{p}_b \\ i[\hat{p}_a, \hat{L}_{cd}] = \delta_{a[c}\hat{p}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}}\hat{p}_a e^{\frac{i}{2}\vartheta^{cd}\hat{L}_{cd}} = [e^{\vartheta}]_a{}^b\hat{p}_b \end{cases}$

Cor. 3.1.5. $e^{\frac{i}{2}\varepsilon^{ab}M_{ab}}\varphi(x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\varphi(e^{-\varepsilon}x), e^{i\theta^a p_a}\varphi(x) = \varphi(x+\theta)$

Cor. 3.1.6. $\langle'|\hat{P}_a|'\rangle = [e^{\vartheta}]_a{}^b\langle|\hat{P}_b|\rangle, \langle'|\hat{J}_{ab}|'\rangle = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\langle|\hat{J}_{cd}|\rangle, \langle'|S_{ab}|'\rangle = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\langle|S_{cd}|\rangle$

Cor. 3.1.7. $\langle'|\hat{P}_a|'\rangle = [e^{\vartheta}]_a{}^b\langle|\hat{P}_b|\rangle, \langle'|\hat{J}_{\alpha_\varsigma}|'\rangle = [e^{(i\omega+\varsigma\epsilon)\cdot\sigma(s)}]_{\alpha_\varsigma}{}^{\beta_\varsigma}\langle|\hat{J}_{\beta_\varsigma}|\rangle$

From the above, we can see that the right side is a Lorentz transformation, and the left side can be seen as a unitary transformation. That is, Lorentz transformation is equivalent to unitary transformation.

Cor. 3.1.8. $[\hat{p}_a, \hat{p}_b] = 0 \Leftrightarrow \hat{p}_a = e^{-i\vartheta^b\hat{p}_b}\hat{p}_a e^{i\vartheta^b\hat{p}_b}$

3.2 Infinite dimensional invariant tensors [25, 26] in the sense of quantum field theory

Cor. 3.2.1. $\begin{cases} i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow \hat{J}_{ab} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d e^{\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}}\hat{J}_{cd}e^{-\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} \\ i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}}\hat{J}_{ab}e^{\frac{i}{2}\vartheta^{ef}\hat{J}_{ef}} = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\hat{J}_{cd} \end{cases}$

Cor. 3.2.2. $\begin{cases} i[\hat{P}_a, \hat{J}_{cd}] = \delta_{a[c}\hat{P}_{d]} \Leftrightarrow \hat{P}_a = [e^{\vartheta}]_a{}^b e^{\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}}\hat{P}_b e^{-\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} \\ i[\hat{P}_a, \hat{J}_{cd}] = \delta_{a[c}\hat{P}_{d]} \Leftrightarrow e^{-\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}}\hat{P}_a e^{\frac{i}{2}\vartheta^{cd}\hat{J}_{cd}} = [e^{\vartheta}]_a{}^b\hat{P}_b \end{cases}$

Cor. 3.2.3. $[\hat{P}_a, \hat{P}_b] = 0 \Leftrightarrow \hat{P}_a = e^{-i\vartheta^b\hat{P}_b}\hat{P}_a e^{i\vartheta^b\hat{P}_b}$

Cor. 3.2.4. $\langle'|\hat{P}_a|'\rangle = [e^{\vartheta}]_a{}^b\langle|\hat{P}_b|\rangle, \langle'|\hat{J}_{ab}|'\rangle = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\langle|\hat{J}_{cd}|\rangle, \langle'|S_{ab}|'\rangle = [e^{\vartheta}]_a{}^c[e^{\vartheta}]_b{}^d\langle|S_{cd}|\rangle$

Cor. 3.2.5. $\langle'|\hat{P}_a|'\rangle = [e^{\vartheta}]_a{}^b\langle|\hat{P}_b|\rangle, \langle'|\hat{J}_{\alpha_\varsigma}|'\rangle = [e^{(i\omega+\varsigma\epsilon)\cdot\sigma(s)}]_{\alpha_\varsigma}{}^{\beta_\varsigma}\langle|\hat{J}_{\beta_\varsigma}|\rangle$

Conjected covariant equation:

Cor. 3.2.6. $[(s+\phi)\hat{P}_a + i\hat{J}_{ab}\hat{P}^b]\psi(s,\varsigma) = 0$

Cor. 3.2.7. $[(s+\phi)\hat{\partial}_a + i\hat{J}_{ab}\hat{\partial}^b]\Psi(x, F[\varphi(y)]) = 0$

Cor. 3.2.8. $(\hat{P}^a\partial_a + m)\Psi(x, F[\varphi(y)]) = 0$

Cor. 3.2.9. $\partial_a\Psi(x, F[\varphi(y)]) = \hat{P}_a\Psi(x, F[\varphi(y)])$

3.3 General invariant tensors [25, 26] in the sense of quantum field theory

Cor. 3.3.1. $\begin{cases} i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow \psi_\lambda = \Lambda_\lambda{}^\mu U^+\psi_\mu U \\ i[\hat{J}_{ab}, \hat{J}_{cd}] = g_{ad}\hat{J}_{bc} - g_{ac}\hat{J}_{bd} + g_{bc}\hat{J}_{ad} - g_{bd}\hat{J}_{ac} \Leftrightarrow U\psi_\lambda U^+ = \Lambda_\lambda{}^\mu\psi_\mu \end{cases}$

Cor. 3.3.2. $U\psi_\lambda U^+ = \Lambda_\lambda{}^\mu\psi_\mu, U = e^{iX}$

3.4 Operator algebra on quantum field theory

Cor. 3.4.1. $[x, \hat{p}_x] = i \Leftrightarrow \hat{p}_x \equiv -i\frac{\partial}{\partial x}, \Psi = \psi(x)$

$\Psi = \int dx F[\psi(x)] = \sum_i \Delta x_i F[\psi(x_i)] = \varepsilon F[\psi(x_1), \psi(x_2), \cdots, \psi(x_n), \cdots, \psi(x_\infty)]$

3.5 How to find eigenstates of arbitrary operators

Chapter5 Constant Invariant Tensor and Representation Transformation

1 Definition of various spinors for general s-spin field

1.1 Penrose abstract symbol rules [1,2]

Cor. 1.1.1. $g^{\mathscr{A}_\varsigma\mathscr{B}_\varsigma}\psi_{\mathscr{B}_\varsigma}=\psi^{\mathscr{A}_\varsigma}=[\psi_{\mathscr{A}_{-\varsigma}}]^*, g_{\mathscr{A}_\varsigma\mathscr{B}_\varsigma}\psi^{\mathscr{B}_\varsigma}=\psi_{\mathscr{A}_\varsigma}=[\psi^{\mathscr{A}_{-\varsigma}}]^*$

The above shows that $\psi_{\mathscr{A}_\varsigma},\psi^{\mathscr{A}_\varsigma}$ are completely related, and only one of them is truly independent. I would choose $\psi_{\mathscr{A}_\varsigma}$ as the base quantity.

1.2 Introduction of field spinors $\psi(s,\varsigma;w),\tilde{\psi}(s,\varsigma;w),\hat{\psi}(s,\varsigma;w)$

Def. 1.2.1. $\psi(s,\varsigma;w)\prec\psi_{k_\varsigma}(s;w)\Leftrightarrow\psi^*(s,-\varsigma;w)\prec\psi^{k_\varsigma}(s;w)$

6 Summary of common matrices

6.1 A non hermitian representation of spin matrix

Starting from the Lorentz transformation property of the fully symmetric two component Weyl spin tensor [5], a special representation of the spin matrix can be obtained.

$$\tau(s)=(\frac{1}{2}\begin{bmatrix}0&2s&0&0&0\\1&0&2s-1&0&0\\0&2&0&\cdots&0\\0&0&\cdots&0&1\\0&0&0&2s&0\end{bmatrix},\frac{i}{2}\begin{bmatrix}0&-2s&0&0&0\\1&0&-(2s-1)&0&0\\0&2&0&\cdots&0\\0&0&\cdots&0&-1\\0&0&0&2s&0\end{bmatrix},\begin{bmatrix}s&0&0&0&0\\0&s-1&0&0&0\\0&0&\cdots&0&0\\0&0&0&-(s-1)&0\\0&0&0&0&-s\end{bmatrix}) \tag{5.6a}$$

$$\sigma(s)=\mathbb{S}(s)\tau(s)\mathbb{S}^{-1}(s),[\tau_{\alpha_\varsigma}(s),\tau_{\beta_\varsigma}(s)]=i\varepsilon_{\alpha_\varsigma\beta_\varsigma}{}^{\gamma_\varsigma}\tau_{\gamma_\varsigma}(s),s=\frac{1}{2},1,\frac{3}{2},2,\frac{5}{2},\cdots \tag{5.6b}$$

$$\tau^2(s)=s(s+1) \tag{5.6c}$$

$$\tau_{\alpha_\varsigma}(s)\prec\tau_{\alpha_\varsigma}{}^{A_\varsigma}{}_{B_\varsigma}(s),\alpha_\varsigma\sim e^{(i\omega+\varsigma\epsilon)\cdot\gamma},{}^{A_\varsigma}\sim e^{(i\omega+\varsigma\epsilon)\cdot\tau(s)},{}_{B_\varsigma}\sim e^{-(i\omega+\varsigma\epsilon)\cdot\tau^T(s)} \tag{5.6d}$$

The metric tensor corresponding to this spin matrix: $\epsilon(s)\bar{\epsilon}(s)=\bar{\epsilon}(s)\epsilon(s)=I$

$$\epsilon_{A_\varsigma B_\varsigma}(s)\succ\epsilon(s)=\begin{bmatrix}0&0&0&0&(-1)^0C_n^0\\0&0&0&(-1)^1C_n^1&0\\0&0&(-1)^2C_n^2&0&0\\0&\cdots&0&0&0\\(-1)^nC_n^n&0&0&0&0\end{bmatrix},C_n^{-k}\equiv(C_n^k)^{-1} \tag{5.7a}$$

Chapter6 New Expressions of Electromagnetic Field Equation

1 Using constant invariant tensors to define various spinors of electromagnetic field [7]

1.1 Classical description of electromagnetic field strength

$$\textbf{Electromagnetic tensor:}F_{ab}=\begin{bmatrix}0 & B_z & -B_y & -iE_x\\ -B_z & 0 & B_x & -iE_y\\ B_y & -B_x & 0 & -iE_z\\ iE_x & iE_y & iE_z & 0\end{bmatrix},\textbf{Dual tensor:}*F_{ab}=\begin{bmatrix}0 & -iE_z & iE_y & B_x\\ iE_z & 0 & -iE_x & B_y\\ -iE_y & iE_x & 0 & B_z\\ -B_x & -B_y & -B_z & 0\end{bmatrix} \tag{6.1}$$

1.2 Complex vector description of electromagnetic field strength

The first definition, it is adopted in this chapter. As follows.

Def. 1.2.1. *The first definition* $\psi_{\alpha_\varsigma}:=\frac{i}{2}\sigma^{ab}_{\varsigma\alpha_\varsigma}F_{ab}=i\varsigma(E-i\varsigma B)_{\alpha_\varsigma}=(i\varsigma E+B)_{\alpha_\varsigma}$

The second definition, it will be used in the subsequent chapters on the separate quantization of electromagnetic fields. As follows.

Def. 1.2.2. *The second definition* $\Psi_{\alpha_\varsigma}:=\frac{\varsigma}{2\sqrt{2}}\sigma^{ab}_{\varsigma\alpha_\varsigma}F_{ab}=\frac{1}{\sqrt{2}}(E-i\varsigma B)_{\alpha_\varsigma}$

The third definition will be used in the subsequent chapter on B-G quantization. As follows.

Def. 1.2.3. *The third definition* $\psi_{\alpha_\varsigma}:=-\frac{1}{2\sqrt{2}}\sigma^{ab}_{\varsigma\alpha_\varsigma}F_{ab}=-\frac{\varsigma}{\sqrt{2}}(E-i\varsigma B)_{\alpha_\varsigma}$

In the future, there will be time to unify them all into the second definition. The later Penrose and B-G quantization commutation rules are defined by using the third definition.

$\Leftrightarrow (\sigma_{-\varsigma}, -i\varsigma)^a{}_{b\alpha_\varsigma}\partial_a\tilde{\Psi}^{\alpha_\varsigma} = iJ_b, \alpha_\varsigma = 1,2,3,4$ □

This equation (3.3.2) is completely equivalent to the electromagnetic field equation. It is just the spin tensor expression of the electromagnetic field equation.

Lem. 2.6.1. $\mathbb{J}_a^{\beta_\varsigma} = -i\sigma_{\varsigma ab}^{\beta_\varsigma}J^b \Leftrightarrow \begin{cases} \mathbb{J}_y^{z_\varsigma} = -\mathbb{J}_z^{y_\varsigma} = -\varsigma\mathbb{J}_\pi^{x_\varsigma} = J^x \\ \mathbb{J}_z^{x_\varsigma} = -\mathbb{J}_x^{z_\varsigma} = -\varsigma\mathbb{J}_\pi^{y_\varsigma} = J^y \\ \mathbb{J}_x^{y_\varsigma} = -\mathbb{J}_y^{x_\varsigma} = -\varsigma\mathbb{J}_\pi^{z_\varsigma} = J^z \\ \mathbb{J}_x^{x_\varsigma} = \mathbb{J}_y^{y_\varsigma} = \mathbb{J}_z{}^{z_\varsigma} = \varsigma J^\pi \end{cases}$

Expand and then we can prove it by expanding. The above spin equation is about special source terms, so what happens to general source terms? Please look at the following theorem.

$\Leftrightarrow (\sigma_{-\varsigma},-i\varsigma)^a{}_{b\alpha_\varsigma}D_a\tilde{\Psi}^{\alpha_\varsigma\sigma} = iJ^\sigma_b, \alpha_\varsigma = 1,2,3,4$ □

This equation (3.3.2) is completely equivalent to the Yang-Mills field equation. It is just the spin tensor expression of the Yang-Mills field equation.

Lem. 2.8.1. $\mathbb{J}^{\beta_\varsigma\sigma}_a = -i\sigma^{\beta_\varsigma}_{\varsigma ab}J^{b\sigma} \Leftrightarrow \begin{cases}\mathbb{J}^{z_\varsigma\sigma}_y = -\mathbb{J}^{y_\varsigma\sigma}_z = -\varsigma\mathbb{J}^{x_\varsigma\sigma}_\pi = J^{x\sigma}\\ \mathbb{J}^{x_\varsigma\sigma}_z = -\mathbb{J}^{z_\varsigma\sigma}_x = -\varsigma\mathbb{J}^{y_\varsigma\sigma}_\pi = J^{y\sigma}\\ \mathbb{J}^{y_\varsigma\sigma}_x = -\mathbb{J}^{x_\varsigma\sigma}_y = -\varsigma\mathbb{J}^{z_\varsigma\sigma}_\pi = J^{z\sigma}\\ \mathbb{J}^{x_\varsigma\sigma}_x = \mathbb{J}^{y_\varsigma\sigma}_y = \mathbb{J}^{z_\varsigma\sigma}_z = \varsigma J^{\pi\sigma}\end{cases}$

Expand and then we can prove it by expanding. The above spin equation is about special source terms, so what happens to general source terms? Please look at the following theorem.

1 Various descriptions of physical quantities of gravitational field [11–14]

1.1 Classical description of physical quantities of gravitational field [11–14]

1.1.1 Curvature tensor of gravitational field

Symmetrical properties of curvature tensor:

Antisymmetry: $R^{abcd} = -R^{bacd}, R^{abcd} = -R^{abdc}$ (8.1)

Symmetry: $R^{abcd} = R^{cdab}$ (8.2)

Cyclic symmetry: $R^{abcd} + R^{adbc} + R^{acdb} = 0$ (8.3)

1.1.2 Ricci tensor and scalar curvature of gravitational field

Def. 1.1.1. *Ricci tensor* $R^{ab} := g_{cd}R^{cadb}, R^{a*b} := g_{cd}R^{ca(*db)} \equiv 0$, *Scalar curvature* $R := g_{ab}R^{ab} = R_{ab}{}^{ab}$

Cor. 1.1.1. $R^{abcd} + R^{adbc} + R^{acdb} = 0 \Rightarrow R^{a*b} = 0$

Proof: $R^{abcd} + R^{adbc} + R^{acdb} = 0$
$\Rightarrow \varepsilon_{ebcd}(R^{abcd} + R^{adbc} + R^{acdb}) = 0$
$\Rightarrow \varepsilon_{ebcd}R^{abcd} + \varepsilon_{edbc}R^{adbc} + \varepsilon_{ecdb}R^{acdb} = 0$

Cor. 1.2.4. $F^{ab\alpha_\varsigma} = \frac{i}{2}\sigma^{\alpha_\varsigma}_{\varsigma cd}\frac{1}{2}[R^{abcd} - \varsigma R^{ab(*cd)}]$

Cor. 1.2.5. $R^{abcd} - \varsigma R^{ab(*cd)} = -\frac{1}{4}\sigma^{cd}_{\varsigma\alpha_\varsigma}\sigma^{\alpha_\varsigma}_{\varsigma ef}(R^{abef} - \varsigma R^{ab(*ef)})$

Cor. 1.2.6. $R^{abcd} = \frac{i}{2}(\sigma^{cd}_{-\alpha'}F^{ab\alpha'} + \sigma^{cd}_{+\alpha}F^{ab\alpha}), R^{ab(*cd)} = \frac{i}{2}(\sigma^{cd}_{-\alpha'}F^{ab\alpha'} - \sigma^{cd}_{+\alpha}F^{ab\alpha})$

Unlike electromagnetic field, gravitational field has the following different conclusions.

Cor. 1.2.7. $R^{ab} = -\frac{i}{2}(F^{\alpha'}\sigma_{-\alpha'} + F^{\alpha}\sigma_{+\alpha})^{ab}, 0 = R^{a*b} = -\frac{i}{2}(F^{\alpha'}\sigma_{-\alpha'} - F^{\alpha}\sigma_{+\alpha})^{ab}$

Cor. 1.2.8. $R^{ab} = -i(F^{\alpha'}\sigma_{-\alpha'})^{ab} = -i(F^{\alpha}\sigma_{+\alpha})^{ab}, F^{\alpha'}\sigma_{-\alpha'} = F^{\alpha}\sigma_{+\alpha}$

Cor. 1.2.9. $R^{ab} = -i(F^{\alpha_\varsigma}\sigma_{\varsigma\alpha_\varsigma})^{ab}, F^{\alpha'_\varsigma}\sigma_{-\varsigma\alpha'_\varsigma} = F^{\alpha_\varsigma}\sigma_{\varsigma\alpha_\varsigma}$

Cor. 1.2.10. $R = i\sigma^{ab}_{\varsigma\alpha_\varsigma}F_{ab}{}^{\alpha_\varsigma}$

1.2.2 Yang-Mills ddescription of gravitational field Weyl tensor

Def. 1.2.2. *gravitational field YM Weyl tensor* $C^{ab\alpha_\varsigma} := \frac{i}{2}\sigma^{\alpha_\varsigma}_{\varsigma cd}C^{abcd}$

Following the reasoning of the curvature tensor situation, there are completely similar conclusions.

This theorem indicates that the source term of this spin equation is limited and not arbitrary. Only the source term case described in the previous theorem has a solution, while the other cases have no solution.

The latter equation is formally equivalent to two electromagnetic field equations with both electric and magnetic charges.It satisfies Lorentz covariant and characterizes a torsion free gravitational field. It has nothing to do with whether the Einstein equation is established or not. Therefore, some analytical techniques for electromagnetic fields can be used here. So that we can obtain some properties of gravity.

The above covariant equation shows that $(\gamma,-i\varsigma)_a$ exhibits some covariance under certain special circumstances. The general covariant equation is constructed based on the Pauli matrix. But this equation uses the photon spin matrix to have constructed a complete covariant equation. This is the first time I have seen such a situation. The reason why this happens is due to the complete symmetry of the field and source.

3.2 Spinor expression of Yang-Mills gauge equation for gravitational field

As long as the Einstein equation $R^{ab} = -8\pi G(T^{ab} - \frac{1}{2}g^{ab}T) + \Lambda g^{ab}$ is substituted into the source terms of various representations of the Bianchi identity and the corresponding identity sign is replaced with an equal sign, various representations of the physical Yang-Mills gauge equation for gravitational field can be obtained. Formally, it is completely consistent with various expressions of the Bianchi identity and will not be written repeatedly. In essence, the Yang-Mills gauge equation for gravitational field is only an identity for gravitational field. It is irrelevant whether the Einstein equation is established or not. But what really describes physics is the Einstein equation. Only after applying the Einstein equation to the source term of the gravitational field gauge identity. And the Yang-Mills gauge equation of the gravitational field truly carries the physical gravitational source term. At this time, the Yang-Mills gauge equation of the gravitational field became a real physical equation. So this is completely different from the case of electromagnetic field and Yang-Mills field. The gauge equations for electromagnetic field and Yang-Mills field are not just identities, but directly describe real physics.

3.3 Self review

In fact, both electromagnetic and gravitational fields can be attributed to the Yang-Mills field case. When σ is empty, it is an electromagnetic field; When $\sigma = \beta_\kappa$, it is a gravitational field; When σ is multiple letters, a more general situation can be described. Therefore, the Yang-Mills field is already a very general case in mathematical form.

Chapter10 Spin Equations for Various Particles

1 Description of spin vector W_a

1.1 Definition of spin vectors $W_a, W_a(s,\varsigma)$

s-spin tensor matrix: $S_{(ab)}(s,\varsigma) = \begin{bmatrix} 0 & \sigma_z(s) & -\sigma_y(s) & -\varsigma\sigma_x(s) \\ -\sigma_z(s) & 0 & \sigma_x(s) & -\varsigma\sigma_y(s) \\ \sigma_y(s) & -\sigma_x(s) & 0 & -\varsigma\sigma_z(s) \\ \varsigma\sigma_x(s) & \varsigma\sigma_y(s) & \varsigma\sigma_z(s) & 0 \end{bmatrix}$ (10.1)

Def. 1.1.1. $W_a := -i * M_{ab}p^b = \frac{-i}{2}\varepsilon_{abcd}M^{bc}p^d$

Def. 1.1.2. $W_a(s,\varsigma) := -i * M_{ab}(s,\varsigma)p^b, M_{ab}(s,\varsigma) = L_{ab} + S_{ab}(s,\varsigma)$

Pro. 1.1.1. $W_a p^a = 0, W_a(s,\varsigma)p^a = 0$

The above shows that the spin vector is orthogonal to momentum and has only three independent components.

Pro. 1.1.2. $*L_{ab}p^b = 0$

Proof: $*L_{ab}p^b = \frac{1}{2}\varepsilon_{abcd}(x^c p^d - x^d p^c)p^b = \varepsilon_{abcd}x^c p^d p^b = \varepsilon_{abcd}x^c p^b p^d = 0$ □

The above shows Orbital angular momentum has no contribution to the spin vector, so the following conclusions are obtained.

Cor. 1.1.1. $\begin{cases} W_a = -i * S_{ab}p^b \\ W_a(s,\varsigma) = -i * S_{ab}(s,\varsigma)p^b = i\varsigma S_{ab}(s,\varsigma)p^b \end{cases}$

1.2 Properties of spin vector $W_a(s,\varsigma)$

Pro. 1.2.1. $W_a(s,\varsigma)W^a(s,\varsigma) = m^2 s(s+1), m^2 = -p_a p^a$

Proof: $W_a(s,\varsigma)W^a(s,\varsigma) = [i\varsigma S_{ab}(s,\varsigma)p^b][i\varsigma S^{ac}(s,\varsigma)p_c]$
$\Leftrightarrow W_a(s,\varsigma)W^a(s,\varsigma) = -p^a S_{ca}(s,\varsigma)S^{cb}(s,\varsigma)p_b$
$\Leftrightarrow W_a(s,\varsigma)W^a(s,\varsigma) = p^a S_{ac}(s,\varsigma)S^c{}_b(s,\varsigma)p^b$
$\Leftrightarrow W_a(s,\varsigma)W^a(s,\varsigma) = -p^a s(s+1)\delta_{ab}p^b$
$\Leftrightarrow W_a(s,\varsigma)W^a(s,\varsigma) = -s(s+1)p_a p^a$
$\Leftrightarrow W_a(s,\varsigma)W^a(s,\varsigma) = m^2 s(s+1), m^2 = -p_a p^a$ □

Using property of the constant tensor S_{ab}, the following general conclusions can be proved.

Pro. 1.2.2. $W_a W^a = m^2 s(s+1), m^2 = -p_a p^a \neq 0$

Proof: $W_a W^a = [-i * S_{ab}p^b][-i * S^{ab}p_b]$
$= -[*S_{ab}(0,0,0,im)^b][*S^{ab}(0,0,0,im)_b]$

$= m^2 * S_{a\pi} * S^{a\pi}$
$= -m^2(S_{xy}^2 + S_{yz}^2 + S_{zx}^2)$
$= m^2 s(s+1)$ □

Pro. 1.2.3. $W_a W^a = p^2 s(s+1) - p^2(S_{x\pi}^2 + S_{y\pi}^2 + S_{xy}^2), m^2 = -p_a p^a = 0$

Proof: $W_a W^a = [-i * S_{ab}p^b][-i * S^{ab}p_b]$
$= -[*S_{ab}(0,0,p,ip)^b][*S^{ab}(0,0,p,ip)_b]$

$= -p^2 * S_{az} * S^{az} - p^2 * S_{a\pi} * S^{a\pi}$
$= p^2(S_{x\pi}^2 + S_{y\pi}^2 + S_{xy}^2) - p^2(S_{xy}^2 + S_{yz}^2 + S_{zx}^2)$
$= p^2 s(s+1) - p^2(S_{x\pi}^2 + S_{y\pi}^2 + S_{xy}^2)$ □

Pro. 1.2.4. $W_a(s,\varsigma)W^a(s,\varsigma)=0, m^2=-p_ap^a=0$

Pro. 1.2.5. $[W_a(s,\varsigma),W_b(s,\varsigma)]=\varsigma[W_a(s,\varsigma)p_b-W_b(s,\varsigma)p_a]-m^2S_{ab}(s,\varsigma)$

Pro. 1.2.6. $\vec{W}(s,\varsigma)=-i\varsigma\sigma(s)\times\vec{p}-i\sigma(s)p_\pi, W_\pi(s,\varsigma)=i\sigma(s)\cdot\vec{p}$

2 Construction of spin equation

2.1 A new particle equation directly constructed by spin quantities
The following particle equation is directly constructed from the spin quantity:

$$[(s+\phi)D_a+iS_{ab}D^b]\psi=\mathbb{J}_a \tag{10.7}$$

ψ is the particle state spinor, s is the particle spin, S_{ab} is the particle spin tensor, ϕ is a scalar field, $\mathbb{J}_a$ is the spinor source and D_a is the covariant derivative.
2.2 Properties of the new particle equation

s-spin matrix: $S_{ab}(s,\varsigma)=i\sigma^{\alpha_\varsigma}_{\varsigma ab}\sigma_{\alpha_\varsigma}(s)\succ\begin{bmatrix}0 & \sigma_z(s) & -\sigma_y(s) & -\varsigma\sigma_x(s)\\ -\sigma_z(s) & 0 & \sigma_x(s) & -\varsigma\sigma_y(s)\\ \sigma_y(s) & -\sigma_x(s) & 0 & -\varsigma\sigma_z(s)\\ \varsigma\sigma_x(s) & \varsigma\sigma_y(s) & \varsigma\sigma_z(s) & 0\end{bmatrix}$

Thm. 2.2.1. $[(s+\phi)\partial_a+iS_{ab}(s,\varsigma)\partial^b]\psi=0\Rightarrow\phi=0\ or\ \phi=-(2s+1)\ or\ \sigma(s)\cdot\nabla\psi=0,\partial_\pi\psi=0$

Proof: $[(s+\phi)\partial_a+iS_{ab}(s,\varsigma)\partial^b]\psi=0$

$$\Leftrightarrow\begin{cases}[(s+\phi)\partial_x+i\sigma_z(s)\partial_y-i\sigma_y(s)\partial_z-i\varsigma\sigma_x(s)\partial_\pi]\psi=0\\ [(s+\phi)\partial_y+i\sigma_x(s)\partial_z-i\sigma_z(s)\partial_x-i\varsigma\sigma_y(s)\partial_\pi]\psi=0\\ [(s+\phi)\partial_z+i\sigma_y(s)\partial_x-i\sigma_x(s)\partial_y-i\varsigma\sigma_z(s)\partial_\pi]\psi=0\\ [(s+\phi)\partial_\pi+i\varsigma\sigma_x(s)\partial_x+i\varsigma\sigma_y(s)\partial_y+i\varsigma\sigma_z(s)\partial_z]\psi=0\end{cases}$$

$$\Rightarrow \begin{cases} [(s+1+\phi)\sigma(s)\cdot\nabla - i\varsigma\sigma^2(s)\partial_\pi]\psi = 0 \\ [(s+\phi)\partial_\pi + i\varsigma\sigma\cdot\nabla]\psi = 0 \end{cases}$$

$$\Leftrightarrow \begin{cases} \sigma(s)\cdot\nabla\psi = i\varsigma(s+\phi)\partial_\pi\psi \\ [(s+\phi)(s+1+\phi) - s(s+1)]\partial_\pi\psi = 0 \end{cases}$$

$\Leftrightarrow \phi = 0$ or $\phi = -(2s+1)$ or $\sigma(s)\cdot\nabla\psi = 0, \partial_\pi\psi = 0$ □

Thm. 2.2.2. $[s\partial_a + iS_{ab}\partial^b]\psi = 0 \Rightarrow \partial_a\partial^a\psi = 0$

Proof: $[s\partial_a + iS_{ab}\partial^b]\psi = 0$
$\Rightarrow \partial^a[s\partial_a + iS_{ab}\partial^b]\psi = 0$
$\Leftrightarrow [s\partial_a\partial^a + iS_{ab}\partial^a\partial^b]\psi = 0$
$\Leftrightarrow [s\partial_a\partial^a + 0]\psi = 0$
$\Leftrightarrow \partial_a\partial^a\psi = 0$ □

This equation describes massless particles.

Thm. 2.2.3. $\begin{cases} \textit{When } \phi \neq 0, [(s+\phi)\partial_a + iS_{ab}(s,\varsigma)\partial^b]\psi(s,\varsigma) = 0 \textit{ has no plane wave solutions.} \\ \textit{When } \phi = 0, [(s+\phi)\partial_a + iS_{ab}(s,\varsigma)\partial^b]\psi(s,\varsigma) = 0 \textit{ has plane wave solutions.} \end{cases}$

Proof: Because this equation describes massless particles, the particle motion direction can always be selected as z, at this time $p_a = (0,0,p,ip)$, then

$$[(s+\phi)p_a + iS_{ab}(s,\varsigma)p^b]\psi(s,\varsigma) = 0$$

In massless case due to complete independence of $F_{ab}{}^{\sigma}, A_a{}^{\sigma}$, it is unable to obtain more concise and meaningful conclusions. And there are redundant equations that appear to be sloppy and not concise enough. It can't be naturally generalized to the high spin case.Therefore, Bargmann Wigner equation seems not suitable for describing massless particles, but Penrose spinor equation [1,2](Spin Equation) is more suitable for describing massless particles.

Using mathematical induction and the reasoning techniques of $s=\frac{3}{2}$ and $s=2$ can easily and strictly prove the above two theorems. Let's begin to prove them.

6.3 Strictly prove the above two theorems by using mathematical induction

Proof: Use mathematical induction to prove the above two theorems together.

Step 1: When $s=1/2$, the following is established:
$$\begin{cases} [\gamma^a(\varsigma)\partial_a+m]\psi_{[\lambda_\varsigma]}{}^\sigma=0 \\ \psi_{\lambda_\varsigma}{}^\sigma\ \text{full symmetric except}\ {}^\sigma \end{cases}\Leftrightarrow\begin{cases} [\gamma^d(\varsigma)\partial_d+m]A_{\underbrace{ab\cdot\cdot}_{0}[\lambda_\varsigma]}{}^\sigma=0,A_{\underbrace{ab\cdot\cdot}_{0}\eta_\varsigma}{}^\sigma\ \text{fully symmetric except}\ {}_{\lambda_\varsigma}{}^\sigma \\ \delta^{ab}A_{\underbrace{ab\cdot\cdot}_{0}[\lambda_\varsigma]}{}^\sigma=0,\gamma^a(\varsigma)A_{\underbrace{ab\cdot\cdot}_{0}[\lambda_\varsigma]}{}^\sigma=0 \\ \psi_{\lambda_\varsigma}{}^\sigma=A_{\underbrace{ab\cdot\cdot}_{0}\lambda_\varsigma}{}^\sigma \end{cases}$$

Step 2: When $s=n-1/2$, the following is established.
$$\begin{cases} [\gamma^a(\varsigma)\partial_a+m]\psi_{\underbrace{[\lambda_\varsigma]\mu_\varsigma\cdot\cdot\eta_\varsigma}_{2n-1}}{}^\sigma=0 \\ \psi_{\underbrace{\lambda_\varsigma\mu_\varsigma\cdot\cdot\eta_\varsigma}_{2n-1}}{}^\sigma\ \text{full symmetric except}\ {}^\sigma \end{cases}\Leftrightarrow\begin{cases} [\gamma^d(\varsigma)\partial_d+m]A_{\underbrace{ab\cdot\cdot}_{n-1}[\eta_\varsigma]}{}^\sigma=0,A_{\underbrace{ab\cdot\cdot}_{n-1}\eta_\varsigma}{}^\sigma\ \text{fully symmetric except}\ {}_{\eta_\varsigma}{}^\sigma \\ \delta^{ab}A_{\underbrace{ab\cdot\cdot}_{n-1}[\eta_\varsigma]}{}^\sigma=0,\gamma^a(\varsigma)A_{\underbrace{ab\cdot\cdot}_{n-1}[\eta_\varsigma]}{}^\sigma=0 \\ \psi_{\underbrace{\lambda_\varsigma\mu_\varsigma\cdot\cdot\eta_\varsigma}_{2n-1}}{}^\sigma=\overbrace{\mathbb{X}^a_{\lambda_\varsigma\mu_\varsigma}\cdot\cdot}^{n-1}A_{\underbrace{a\cdot\cdot}_{n-1}\eta_\varsigma}{}^\sigma \end{cases}$$

Step 3: When $s=n$,
$$1\begin{cases} [\gamma^a(\varsigma)\partial_a+m]\psi_{\underbrace{[\lambda_\varsigma]\mu_\varsigma\cdot\cdot\eta_\varsigma\xi_\varsigma}_{2n}}{}^\sigma=0 \\ \psi_{\underbrace{\lambda_\varsigma\mu_\varsigma\cdot\cdot\eta_\varsigma\xi_\varsigma}_{2n}}{}^\sigma\ \text{full symmetric except}\ \sigma \end{cases}$$

This step proves that when $s=n$ and $s=n+1/2$, the proposition is established.

Step 5: Based on the above inductive reasoning, the proposition is established and proved simultaneously. □

6.4 Review of s-spin Bargmann-Wigner equation with mass

From the above, it can be seen that Bargmann Wigner equation is equivalent to Rarita Schwinger equation in semi integer spin case [17] and is equivalent to Klein Gordon equation in integer spin case [21] in a flat space-time. It reveals the profound and rich physical connotation of Bargmann Wigner equation. However, if we consider the general source term, we can't obtain this equivalent result. Only a source term that meets certain conditions can be established. And only the spins with $s=\frac{1}{2}$ and $s=1$ can have a source term. For a spin with $s=\frac{3}{2}$ or more, the intrinsic self consistency of the equation requires that the source term must be zero. In addition in curved space-time due to the existence of the generalized covariant derivative term, this equivalent conclusion no longer holds. This situation is not as good as the properties of Penrose spinor equation or the spin equation. In general, Penrose spinor equation or spin equation is more suitable for describing massless particles, while Bargmann Wigner equation is more suitable for describing massive particles.

Chapter13 Advanced Representation Transformation Technology

Self comment: In this chapter, I have made a further in-depth study of representation transformation. Through various complex representation transformation techniques, some useful conclusions have been obtained. It is very useful for studying the Lorentz transformation of various spin particles.

1 Advanced representation transformation technology

1.1 Representation transformation and constant invariant tensors

Thm. 1.1.1. $\psi' = S\psi \Rightarrow \Lambda(\psi') = S\Lambda(\psi)S^{-1} \Leftrightarrow S = \Lambda(\psi')S\Lambda^{-1}(\psi) \Leftrightarrow S^{-1} = \Lambda(\psi)S^{-1}\Lambda^{-1}(\psi')$

Therefore, the representation transformation is a second order constant invariant tensor. The component form is as follows:

Cor. 1.1.1. $\psi'^{\alpha'} = S^{\alpha'}{}_{\alpha}\psi^{\alpha}, \psi^{\alpha} = S^{-1\alpha}{}_{\alpha'}\psi^{\alpha'}$

1.2 Introduction of representation transformation matrix $\tilde{S}(s)$ and constant matrix $\Sigma(s)$

1.2.1 Introduction of representation transformation matrix $\tilde{S}(s)$

Def. 1.2.1. $\tilde{S}(s) := \begin{bmatrix} \bar{N}(s) \\ \bar{X}(s) \end{bmatrix}, \tilde{S}^{+}(s) = [N(s), X(s)]$

Cor. 1.2.1. $\begin{cases} \tilde{S}^{+}(s)\tilde{S}(s) = I_{4s} \Leftrightarrow N(s)\bar{N}(s) + X(s)\bar{X}(s) = I_{4s} \\ \tilde{S}(s)\tilde{S}^{+}(s) = I_{4s} \Leftrightarrow \bar{N}(s)N(s) = I_{2s+1}, \bar{X}(s)X(s) = I_{2s-1}, \bar{N}(s)X(s) = 0, \bar{X}(s)N(s) = 0 \end{cases}$

Cor. 1.2.2. $\begin{cases} \tilde{S}(s)[\sigma(\frac{1}{2}) \otimes I_{2s} + I \otimes \sigma(s-\frac{1}{2})] = \begin{bmatrix} \sigma(s) & 0 \\ 0 & \sigma(s-1) \end{bmatrix} \tilde{S}(s) \\ [\sigma(\frac{1}{2}) \otimes I_{2s} + I \otimes \sigma(s-\frac{1}{2})]\tilde{S}^{+}(s) = \tilde{S}^{+}(s) \begin{bmatrix} \sigma(s) & 0 \\ 0 & \sigma(s-1) \end{bmatrix} \end{cases}$

Cor. 1.2.3. $\tilde{S}(s)[\sigma(\frac{1}{2}) \otimes I_{2s} + I \otimes \sigma(s-\frac{1}{2})]\tilde{S}^{+}(s) = \begin{bmatrix} \sigma(s) & 0 \\ 0 & \sigma(s-1) \end{bmatrix}$

This step proves that when $s' = s$ it is established.

Step 4: Based on the above inductive reasoning, the proposition is established and the theorem is proved. □

Cor. 1.4.1. $\hat{S}(s)\Omega(s)\hat{S}^{+}(s) = \begin{bmatrix} \sigma(s) & 0 & 0 & 0 & 0 & 0 \\ 0 & \pi(s,0) & 0 & 0 & 0 & 0 \\ 0 & 0 & \pi(s,\frac{1}{2}) & 0 & 0 & 0 \\ 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 0 & 0 & \pi(s,s-\frac{3}{2}) & 0 \\ 0 & 0 & 0 & 0 & 0 & \pi(s,s-1) \end{bmatrix}$

Finally, the above conclusion has been strictly proved, and the previous complex properties of some constant invariant tensors can be easily obtained, as follows:

Self comment: As long as the above method is followed, any $\Omega(s)$ can be concretely decomposed into the direct sum of multiple single spin states through representation transformation. In principle, this problem has been completely solved. In practical application, some calculations need to be made to explicitly write out the concrete representation transformation for use. At the same time, it is also constructively proved that $\Omega(s)$is indeed composed entirely of single spin states and there is no redundant components. $\Omega(s)$ does not contain both Bose and Fermi spin states, but rather represents a Bose or Fermi multiple state. And it traverses high and low boson or Fermi spin states. Generally, except for the highest spin state, other spin states have multiple redundant states.

2 Relativistic Lorentz boost transformation of a single particle

2.1 Lorentz transformation of coordinates [22–24]

Convention: The speed of O is $\vec{v}, v \neq 1$ in O'. The speed of O' is $-\vec{v}$ in O. The benefit of this convention is that it can visually describe moving particles. The general form of the relativistic Lorentz boost transformation of coordinates and their coordinate differentials:

Def. 2.1.1. $\begin{cases} \nabla' = \nabla - \gamma_v\vec{v}\partial_t + (\gamma_v - 1)\vec{v}/v^2(\vec{v}\cdot\nabla) \\ \partial_{t'} = \gamma_v(\partial_t - \vec{v}\cdot\nabla), \gamma_v \equiv (1-v^2)^{-\frac{1}{2}} \end{cases}$

Def. 2.1.2. $\begin{cases} \vec{r'} = \vec{r} + \gamma_v\vec{v}t + (\gamma_v - 1)(\vec{v}\cdot\vec{r})\vec{v}/v^2 \\ t' = \gamma_v(t + \vec{v}\cdot\vec{r}), \gamma_v \equiv (1-v^2)^{-\frac{1}{2}} \end{cases}$ $\begin{cases} d\vec{r'} = d\vec{r} + \gamma_v\vec{v}dt + (\gamma_v - 1)(\vec{v}\cdot d\vec{r})\vec{v}/v^2 \\ dt' = \gamma_v(dt + \vec{v}\cdot d\vec{r}) \end{cases}$

The above transformation is an important foundation for the entire theory of special relativity, and another important transformation is the vector rotation transformation.

Cor. 2.1.1. $\vec{r'}^2 - t'^2 = \vec{r}^2 - t^2 = invariant, d\vec{r'}^2 - dt'^2 = d\vec{r}^2 - dt^2 = invariant$

Def. 2.1.3. $L_{\vec{v}} := \begin{bmatrix} 1 & 0 & 0 & -i\gamma_v v_x \\ 0 & 1 & 0 & -i\gamma_v v_y \\ 0 & 0 & 1 & -i\gamma_v v_z \\ i\gamma_v v_x & i\gamma_v v_y & i\gamma_v v_z & \gamma_v \end{bmatrix} + \frac{\gamma_v - 1}{v^2}\begin{bmatrix} v_xv_x & v_xv_y & v_xv_z & 0 \\ v_yv_x & v_yv_y & v_yv_z & 0 \\ v_zv_x & v_zv_y & v_zv_z & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, L_{\vec{v}}L_{-\vec{v}} = L_{-\vec{v}}L_{\vec{v}} = I$

Cor. 2.1.2. $L_{\vec{v}}\begin{bmatrix}\vec{0}\\i\end{bmatrix}=e^{-ln[\gamma_v(1+v)]\hat{v}\cdot L}\begin{bmatrix}\vec{0}\\i\end{bmatrix}=\begin{bmatrix}\gamma_v\vec{v}\\i\gamma_v\end{bmatrix},L_{\vec{v}}\begin{bmatrix}\vec{0}\\im\end{bmatrix}=e^{-ln[\gamma_v(1+v)]\hat{v}\cdot L}\begin{bmatrix}\vec{0}\\im\end{bmatrix}=\begin{bmatrix}\vec{p}\\iE\end{bmatrix}$

Lem. 2.1.1. $(\vec{v}\cdot R)^2+(\vec{v}\cdot L)^2=\vec{v}^2$

Cor. 2.1.3.
$L_{\vec{v}}=e^{-ln[\gamma_v(1+v)]\hat{v}\cdot L}=1-\gamma_v(\vec{v}\cdot L)+\frac{\gamma_v-1}{v^2}(\vec{v}\cdot L)^2=\gamma_v(1-\vec{v}\cdot L)-\frac{\gamma_v-1}{v^2}(\vec{v}\cdot R)^2,L_{\vec{v}}L_{-\vec{v}}=L_{-\vec{v}}L_{\vec{v}}=I$

Cor. 2.1.4. $X'=L_{\vec{v}}dX,X\equiv\begin{bmatrix}\vec{r}\\it\end{bmatrix},X'\equiv\begin{bmatrix}\vec{r'}\\it'\end{bmatrix};dX'=L_{\vec{v}}dX,dX\equiv\begin{bmatrix}d\vec{r}\\idt\end{bmatrix},dX'\equiv\begin{bmatrix}d\vec{r'}\\idt'\end{bmatrix}$

2.2 Velocity synthesis formula

Cor. 2.2.1. $\vec{u}'=[\vec{u}+\gamma_v\vec{v}+(\gamma_v-1)(\vec{v}\cdot\vec{u})\vec{v}/v^2]/[\gamma_v(1+\vec{v}\cdot\vec{u})]$

Cor. 2.2.2. $1-\vec{u}'^2=\frac{(1-\vec{u}^2)(1-\vec{v}^2)}{(1+\vec{v}\cdot\vec{u})^2}$

Cor. 2.2.3. $\begin{cases}\gamma_{u'}\vec{u}'=\gamma_u\vec{u}+\gamma_v\vec{v}\gamma_u+(\gamma_v-1)[\vec{v}\cdot(\gamma_u\vec{u})]\vec{v}/v^2\\\gamma_{u'}=\gamma_v[\gamma_u+\vec{v}\cdot(\gamma_u\vec{u})]\end{cases}\Leftrightarrow\begin{bmatrix}\gamma_{u'}\vec{u'}\\i\gamma_{u'}\end{bmatrix}=L_{\vec{v}}\begin{bmatrix}\gamma_u\vec{u}\\i\gamma_u\end{bmatrix}$

2.3 Lorentz boost transformation of four momentum particles with mass

Massive particles: $m_0\neq0,u\neq1,u'\neq1$

Def. 2.3.1. $E\equiv m_0(1-u^2)^{-\frac{1}{2}},E'\equiv m_0(1-u'^2)^{-\frac{1}{2}},\vec{p}\equiv E\vec{u},\vec{p'}\equiv E'\vec{u'}$

The following Lorentz boost transformation of energy and momentum can be derived from the Lorentz boost transformation of coordinates.

Cor. 2.3.1. $\begin{cases}\vec{p'}=\vec{p}+\gamma_vE\vec{v}+(\gamma_v-1)(\vec{v}\cdot\vec{p})\vec{v}/v^2\\E'=\gamma_v(E+\vec{v}\cdot\vec{p})\end{cases}\Leftrightarrow\begin{bmatrix}\vec{p'}\\iE'\end{bmatrix}=L_{\vec{v}}\begin{bmatrix}\vec{p}\\iE\end{bmatrix}$

Cor. 2.3.2. $\vec{p'}^2-E'^2=\vec{p}^2-E^2=-m_0^2=invariant$

2.4 Temperature lorentz transform conjecture between different velocity reference frames

Ass. 2.4.1.
$\begin{cases}\textit{Kinetic energy of motion system - translational kinetic energy of particle system}=E'_k-E'_{k0}=\sum\limits_i(\gamma_vE_i-m_0)-(\gamma_v-1)\sum\limits_i\\\textit{Kinetic energy of a stationary system - translational kinetic energy of particle system}=E_k-E_{k0}=\sum\limits_i(E_i-m_0)-0=\frac{3}{2}Nk\end{cases}$
$T'=T$

2.5 Lorentz boost transformation of four momentum for massless particles

massless particles: $m_0=0,u=1,u'=1$

Def. 2.5.1. $\vec{p}\equiv E\vec{u},\vec{p'}\equiv E'\vec{u'}$

Starting from the Lorentz push transformation of coordinates for massless particles, it is not strictly possible to derive the Lorentz push transformation of energy and momentum. But it can be obtained by making the mass infinitely close to zero.

$$\begin{cases}\vec{p'}=\vec{p}+\gamma_vE\vec{v}+(\gamma_v-1)(\vec{v}\cdot\vec{p})\vec{v}/v^2\\E'=\gamma_v(E+\vec{v}\cdot\vec{p})\end{cases},\begin{bmatrix}\vec{p'}\\iE'\end{bmatrix}=L_{\vec{v}}\begin{bmatrix}\vec{p}\\iE\end{bmatrix}\quad(14.6)$$

Cor. 2.5.1. $\vec{p'}^2-E'^2=\vec{p}^2-E^2=0=invariant$

2.6 Lorentz boost transformation of a single particle external force

Def. 2.6.1. $\vec{F}\equiv\frac{dp}{dt},\vec{F'}\equiv\frac{dp'}{dt'},\vec{f}\equiv\frac{\vec{F}}{\sqrt{1-u^2}},\vec{f'}\equiv\frac{\vec{F'}}{\sqrt{1-u'^2}}$

3.3 Moving particle system boost transform to static particle system

Lem. 3.3.1. $|\sum\limits_i\vec{p}_i/\sum\limits_i E_i|\le 1$, *The equal sign exists and only if* $\vec{p}_i=E_i\vec{1}$ *is established.*

Lorentz boost transformation from a massive moving particle system to a static particle system:

$$\vec{v}=-\sum_i\vec{p}_i/\sum_i E_i\neq\vec{1}\Rightarrow\begin{cases}\vec{P}(\vec{v})=\sum\limits_i[\vec{p}_i+\gamma_vE_i\vec{v}+(\gamma_v-1)(\vec{v}\cdot\vec{p}_i)\vec{v}/v^2]=0\\ M_0=H(\vec{v})=\sum\limits_i\gamma_v(E_i+\vec{v}\cdot\vec{p}_i)=\sum\limits_i E_i/\gamma_v\end{cases}\tag{14.9}$$

3.4 Static particle system boost transform to moving particle system

Static particle system boost transform to moving particle system:

$$\sum_i\vec{p}_i/\sum_i E_i=0\Rightarrow\begin{cases}H(\vec{v})=\gamma_v\sum\limits_i E_i=M,M\equiv\gamma_vM_0,M_0\equiv\sum\limits_i E_i\\ \vec{P}(\vec{v})=\gamma_v\vec{v}\sum\limits_i E_i=M\vec{v}\end{cases}\tag{14.10}$$

The physical meaning of the above relationship is: You can equate a particle system to a particle. When the particle system moves, it can be equivalent to the motion of a particle. And it conforms to the laws of relativity just like particles. When the massive center of the particle system is static, the total energy of the particle system is just the equivalent static mass of the particle system. The

total energy of the moving particle system is just the equivalent relativistic moving mass. Therefore, a particle system can be completely equivalent to a particle. And conversely, a fundamental particle can also be considered to be a particle system. The difficulty is whether there is such a conclusion for the system of particles with interaction? Can we apply a constraint to the interaction and obtain new physics based on this clue?

3.5 Lorentz boost transformation of unidirectional multiphoton system

Lorentz boost transformation of unidirectional multiphoton system:

$$\vec{p}_i = E_i\vec{1}, \vec{1}' = [\vec{1} + \gamma_v\vec{v} + (\gamma_v - 1)(\vec{v}\cdot\vec{1})\vec{v}/v^2]/[\gamma_v(1+\vec{v}\cdot\vec{1})] \tag{14.11}$$

$$\Rightarrow \begin{cases} \vec{P}(\vec{v}) = \sum\limits_i [E_i\vec{1} + \gamma_v E_i\vec{v} + (\gamma_v - 1)(\vec{v}\cdot\vec{1})E_i\vec{v}/v^2] = \sum\limits_i \gamma_v E_i(1+\vec{v}\cdot\vec{1})\vec{1}' \\ H(\vec{v}) = \sum\limits_i \gamma_v E_i(1+\vec{v}\cdot\vec{1}) \\ \vec{P}^2(\vec{v}) - H^2(\vec{v}) = -M_0^2, M_0 = \sum\limits_i E_i\sqrt{1-1'^2} = 0 \end{cases} \tag{14.12}$$

3.6 Universal static mass formula for particle systems

Based on the above conclusions, the following universal static mass formula can be obtained.

$$M_0 = \sum_i E_i\sqrt{1 - (\sum_i \vec{p}_i/\sum_i E_i)^2} = \sqrt{(\sum_i E_i)^2 - (\sum_i \vec{p}_i)^2} = \sqrt{\sum_{i,j}(E_iE_j - \vec{p}_i\cdot\vec{p}_j)} \tag{14.13}$$

5 Polynomial representation of Lorentz transformation for various spin particles

The above method is tedious, intuitive, and speculative. Below, a more analytical, rigorous, organized, systematic analysis and derivation method will be used. It will get a more general and universal conclusion.

5.1 Mathematical preparation

5.1.1 Definition

Def. 5.1.1. $e(s, n, \sigma) \equiv (\overbrace{I \otimes \cdots \otimes I \otimes}^{n-1} \sigma \overbrace{\otimes I \otimes \cdots \otimes I}^{2s-n})$

Def. 5.1.2. $\hat{\Omega}(s) \equiv \hat{\Omega}(s, 1, \sigma) \equiv \sum_{n=1}^{2s} e(s, n, \sigma), \Omega(s) \equiv \frac{1}{2}\hat{\Omega}(s, 1, \sigma)$

$\hat{\Omega}(s, 1, \vec{\vartheta} \cdot \sigma) \equiv \sum_{n=1}^{2s} e(s, n, \vec{\vartheta} \cdot \sigma) = \vec{\vartheta} \cdot \hat{\Omega}(s, 1, \sigma)$

$\hat{\Omega}(s, 2, \vec{\vartheta} \cdot \sigma) \equiv \frac{1}{2!}\sum_{i\neq j}^{1,2s} e(s, i, \vec{\vartheta} \cdot \sigma)e(s, j, \vec{\vartheta} \cdot \sigma)$

$\hat{\Omega}(s, n, \vec{\vartheta} \cdot \sigma) \equiv \frac{1}{n!}\sum_{i_1\neq i_2\cdots\neq i_n}^{1,2s} e(s, i_1, \vec{\vartheta} \cdot \sigma)e(s, i_2, \vec{\vartheta} \cdot \sigma) \cdots e(s, i_n, \vec{\vartheta} \cdot \sigma),$

5.1.2 Important properties

Pro. 5.1.1. $\hat{\Omega}(s, 2, \vec{\vartheta} \cdot \sigma) = \frac{1}{2}\hat{\Omega}^2(s, 1, \vec{\vartheta} \cdot \sigma) - s\vec{\vartheta}^2$

Pro. 5.1.2. $\hat{\Omega}(s \leq 2, n, \vec{\vartheta} \cdot \sigma) = \frac{1}{n!}\hat{\Omega}^n(s, 1, \vec{\vartheta} \cdot \sigma)u(n - 1)$
$- \frac{1}{n!}(\frac{2sC^{n-2}_{2s-1}}{C^{n-2}_{2s}})[C^2_n(n-2)!]\vec{\vartheta}^2\hat{\Omega}(s, n-2, \vec{\vartheta} \cdot \sigma)u(n-2) - \frac{1}{n!}(\frac{2sC^{n-3}_{2s-1}}{C^{n-2}_{2s}})[C^3_n(n-3)!]\vec{\vartheta}^2\hat{\Omega}(s, n-2, \vec{\vartheta} \cdot \sigma)u(n-3) + \cdots$
$= \frac{1}{n!}\hat{\Omega}^n(s, 1, \vec{\vartheta} \cdot \sigma)u(n-1) - [s - \frac{1}{2}(n-2)]\vec{\vartheta}^2\hat{\Omega}(s, n-2, \vec{\vartheta} \cdot \sigma)u(n-2) - \frac{1}{6}(n-2)\vec{\vartheta}^2\hat{\Omega}(s, n-2, \vec{\vartheta} \cdot \sigma)u(n-3) - \frac{5}{3}\vec{\vartheta}^4\delta_{n,4}$

Chapter15 Mathematical Analysis of Helicity

Self comment: In order to further study the physics of various spin particles, I developed a mathematical analysis method of helicity in this chapter. It provides a powerful mathematical tool for studying various spin particles.

1 Spatial rotation transformation of unit vector

1.1 Spatial rotation transformation of 1-spin spinor

Pro. 1.1.1. $e^{\vec{\vartheta}\cdot\bar{\Omega}(1)} = 1 + \frac{sinh\sqrt{\vec{\vartheta}^2}}{\sqrt{\vec{\vartheta}^2}}[\vec{\vartheta}\cdot\bar{\Omega}(1)] + \frac{cosh\sqrt{\vec{\vartheta}^2}-1}{\vec{\vartheta}^2}[\vec{\vartheta}\cdot\bar{\Omega}(1)]^2$

$\Rightarrow e^{i\vec{\omega}\cdot\gamma} = 1 + i\hat{\omega}\cdot\gamma sin\omega + (i\hat{\omega}\cdot\gamma)^2(1-cos\omega), \omega := |\vec{\omega}|$

Cor. 1.1.1. $e^{i\vec{\omega}\cdot\gamma} = 1 + sin\omega\begin{bmatrix} 0 & \hat{\omega}_z & -\hat{\omega}_y \\ -\hat{\omega}_z & 0 & \hat{\omega}_x \\ \hat{\omega}_y & -\hat{\omega}_x & 0 \end{bmatrix} + (1-cos\omega)\begin{bmatrix} \hat{\omega}_x^2-1 & \hat{\omega}_x\hat{\omega}_y & \hat{\omega}_x\hat{\omega}_z \\ \hat{\omega}_y\hat{\omega}_x & \hat{\omega}_y^2-1 & \hat{\omega}_y\hat{\omega}_z \\ \hat{\omega}_z\hat{\omega}_x & \hat{\omega}_z\hat{\omega}_y & \hat{\omega}_z^2-1 \end{bmatrix}$

Cor. 1.1.2. $e^{i\vec{\omega}\cdot\sigma(1)} = 1 + i\hat{\omega}\cdot\sigma(1)sin\omega + [i\hat{\omega}\cdot\sigma(1)]^2(1-cos\omega)$

1.2 Spatial rotation transformation of unit vector $\hat{p}$

Def. 1.2.1. $\hat{\omega}_+ := \frac{1}{\sqrt{2}}(\hat{\omega}_x + i\hat{\omega}_y), \hat{\omega}_- := \frac{1}{\sqrt{2}}(\hat{\omega}_x - i\hat{\omega}_y), \hat{p}_+ := \frac{1}{\sqrt{2}}(\hat{p}_x + i\hat{p}_y), \hat{p}_- := \frac{1}{\sqrt{2}}(\hat{p}_x - i\hat{p}_y)$

Thm. 1.2.1. $\hat{p} = exp\{i\frac{(\gamma\times\hat{p})_z}{\sqrt{1-\hat{p}_z^2}}arccos\hat{p}_z\}\begin{bmatrix}0\\0\\1\end{bmatrix}, 0 \le arccos\hat{p}_z \le \pi$

Proof: $\hat{p} = e^{i\vec{\omega}\cdot\gamma}\begin{bmatrix}0\\0\\1\end{bmatrix} = \begin{bmatrix}0\\0\\1\end{bmatrix} + sin\omega\begin{bmatrix}-\hat{\omega}_y\\ \hat{\omega}_x\\0\end{bmatrix} + (1-cos\omega)\begin{bmatrix}\hat{\omega}_x\hat{\omega}_z\\ \hat{\omega}_y\hat{\omega}_z\\ \hat{\omega}_z^2-1\end{bmatrix}$

$$\Leftrightarrow \begin{cases} \hat{p}_x = -\hat{\omega}_y sin\omega + \hat{\omega}_x\hat{\omega}_z(1-cos\omega) \\ \hat{p}_y = \hat{\omega}_x sin\omega + \hat{\omega}_y\hat{\omega}_z(1-cos\omega) \\ \hat{p}_z = 1 + (\hat{\omega}_z^2-1)(1-cos\omega) \end{cases} \overset{\hat{\omega}_z=0}{\Rightarrow} \begin{cases} \hat{p}_x = -\hat{\omega}_y sin\omega \\ \hat{p}_y = \hat{\omega}_x sin\omega \\ \hat{p}_z = cos\omega \end{cases} \Leftarrow \begin{cases} \hat{\omega}_x = \frac{\hat{p}_y}{\sqrt{1-\hat{p}_z^2}} \\ \hat{\omega}_y = \frac{-\hat{p}_x}{\sqrt{1-\hat{p}_z^2}} \\ \hat{\omega}_z = 0, 0 \le \omega = arccos\hat{p}_z \le \pi \end{cases}$$

$\Rightarrow \hat{p} = exp\{i\frac{(\gamma\times\hat{p})_z}{\sqrt{1-\hat{p}_z^2}}arccos\hat{p}_z\}\begin{bmatrix}0\\0\\1\end{bmatrix}, 0 \le arccos\hat{p}_z \le \pi$ □

6.7 Eigenstate $\lambda(\hat{p}, -s\varsigma)$ of spin vector operators

Def. 6.7.1. $\lambda(\hat{p}, -s\varsigma) := \lambda(\hat{p}, -s\varsigma; s)$

Thm. 6.7.1. $[s\begin{bmatrix}0\\0\\1\\i\end{bmatrix}_a + iS_{ab}(s,\varsigma)\begin{bmatrix}0\\0\\1\\i\end{bmatrix}^b]\lambda(\begin{bmatrix}0\\0\\1\end{bmatrix}, -s\varsigma) \equiv 0[\Leftrightarrow][s\hat{p}_a + iS_{ab}(s,\varsigma)\hat{p}^b]\lambda(\hat{p}, -s\varsigma) \equiv 0$

Thm. 6.7.2. $[s\hat{p}_a + iS_{ab}(s,\varsigma)\hat{p}^b]\lambda(\hat{p}, -s\varsigma) = 0[\Leftrightarrow]\begin{cases}W_a(\hat{p},\varsigma;s)\lambda(\hat{p},-s\varsigma) = -s\varsigma\hat{p}_a\lambda(\hat{p},-s\varsigma)\\ W_a(\hat{p},\varsigma;s) := -i * S_{ab}(s,\varsigma)\hat{p}^b = i\varsigma S_{ab}(s,\varsigma)\hat{p}^b\end{cases}$

Pro. 6.7.1. $W_a(\hat{p},\varsigma;s) = (\hat{W}(\hat{p},\varsigma;s), i\sigma(s)\cdot\hat{p}), \hat{W}(\hat{p},\varsigma;s) = \sigma(s) - i\varsigma\sigma(s)\times\hat{p}$

Cor. 6.7.1. $\hat{W}(\hat{p},\varsigma;s)\lambda(\hat{p},-s\varsigma) = -s\varsigma\hat{p}\lambda(\hat{p},-s\varsigma)[\Rightarrow]\sigma(s)\cdot\hat{p}\lambda(\hat{p},-s\varsigma) = -s\varsigma\lambda(\hat{p},-s\varsigma)$

Cor. 6.7.2. $\hat{W}(\hat{p},\varsigma;s)\lambda(\hat{p},-s\varsigma) = -s\varsigma\hat{p}\lambda(\hat{p},-s\varsigma)[\Leftrightarrow]W_a(\hat{p},\varsigma;s)\lambda(\hat{p},-s\varsigma) = -s\varsigma\hat{p}_a\lambda(\hat{p},-s\varsigma)$

$\lambda(\hat{p},-s\varsigma)$ is a common eigenstate of helicity operator, 4D spin vector operator and spin vector operator. Essentially, the spin vector operator already fully encompasses the first two operators. So $\lambda(\hat{p},-s\varsigma)$ is essentially just the eigenstate of the spin vector operator $\hat{W}(\hat{p},\varsigma;s)$. The other two are just its deductions. And $\lambda(\hat{p},-s\varsigma)$ is just the eigenstate of a massless particle.

Chapter16 Mathematical Analysis of Spin Algebra

Self comment: In order to further study the physical content of general spin particles, I have independently developed the following mathematical analysis of spin algebra in this chapter. It provides another new mathematical tool for studying various spin particles.

1 Basic algebraic properties of spin unit vector operator

1.1 Basic operator rules for $\sigma(s), \vec{p}$

Pro. 1.1.1. $$\begin{cases} \sigma(s)\times\vec{p}=[\sigma(s), i\sigma(s)\cdot\vec{p}]=i\{\sigma(s)[\sigma(s)\cdot\vec{p}]-[\sigma(s)\cdot\vec{p}]\sigma(s)\} \\ \vec{p}\times\sigma(s)=-[\sigma(s), i\sigma(s)\cdot\vec{p}]=i\{[\sigma(s)\cdot\vec{p}]\sigma(s)-\sigma(s)[\sigma(s)\cdot\vec{p}]\} \end{cases}$$

Pro. 1.1.2. $$\begin{cases} \sigma(s)\times\vec{p}=-\vec{p}\times\sigma(s) \\ \sigma(s)\times\sigma(s)=i\sigma(s) \end{cases} \quad \begin{cases} \sigma(s)\cdot\vec{p}=\vec{p}\cdot\sigma(s) \\ \sigma^2(s)=s(s+1) \end{cases} \quad \begin{cases} [\sigma(s)\times\vec{p}]\cdot\vec{p}=0 \\ \sigma(s)\cdot[\sigma(s)\times\vec{p}]=i\sigma(s)\cdot\vec{p} \\ [\vec{p}\times\sigma(s)]\cdot\sigma(s)=i\sigma(s)\cdot\vec{p} \end{cases}$$

Pro. 1.1.3. $$\begin{cases} [\sigma(s)\times\vec{p}]\times\vec{p}=[\sigma(s)\cdot\vec{p}]\vec{p}-\sigma(s)(\vec{p}\cdot\vec{p}) \\ \sigma(s)\times[\sigma(s)\times\vec{p}]=[\sigma(s)\cdot\vec{p}]\sigma(s)-\sigma^2(s)\vec{p} \\ [\vec{p}\times\sigma(s)]\times\sigma(s)=\sigma(s)[\sigma(s)\cdot\vec{p}]-\sigma^2(s)\vec{p} \\ \sigma(s)\times\{\sigma(s)\times[\sigma(s)\times\vec{p}]\}=\sigma(s)\times\{[\sigma(s)\cdot\vec{p}]\sigma(s)\}-\sigma(s)\times\vec{p}\sigma^2(s) \\ \sigma(s)\times\{\sigma(s)\times[\sigma(s)\times\vec{p}]\}=\sigma(s)\times\{[\sigma(s)\cdot\vec{p}]\sigma(s)\}-\sigma(s)\times\vec{p}\sigma^2(s) \end{cases}$$

Pro. 1.1.4. $$\begin{cases} i^{2k-1}\hat{p}\cdot\{\sigma(s)\times\{\sigma(s)[\times\hat{p}|]^{2k-1}\}\}=i\{[\sigma(s)\cdot\hat{p}]^2-\sigma^2(s)\} \\ i^{2k}\hat{p}\cdot\{\sigma(s)\times\{\sigma(s)[\times\hat{p}|]^{2k}\}\}=i\sigma(s)\cdot\hat{p} \end{cases}$$

Pro. 1.1.5. $$\begin{cases} \{[\sigma(s)\times\vec{p}]\times\vec{p}\}\cdot\vec{p}=0 \\ \{\sigma(s)\times[\sigma(s)\times\vec{p}]\}\cdot\sigma(s)=0 \\ \sigma(s)\cdot\{[\vec{p}\times\sigma(s)]\times\sigma(s)\}=0 \end{cases} \quad \begin{cases} \vec{p}\cdot\{[\sigma(s)\times\vec{p}]\times\vec{p}\}=0 \\ \sigma(s)\cdot\{\sigma(s)\times[\sigma(s)\times\vec{p}]\}=-\sigma(s)\cdot\vec{p} \\ \{[\vec{p}\times\sigma(s)]\times\sigma(s)\}\cdot\sigma(s)=-\sigma(s)\cdot\vec{p} \end{cases}$$

Scalar product algebra of spin unit vector: Finite discrete algebra

Pro. 1.2.9.
$$\begin{cases}<\sigma(s)\cdot\hat{p};\cdot>,\textit{Meet closure; Satisfying commutative and associative laws; There are no zero elements and unit elements.} \\ <\sigma(s)\cdot\hat{p};\cdot>=\sum\limits_{k=0}^{2s}c_k[\sigma(s)\cdot\hat{p}]^k \\ \textit{Linear independence: }\sum\limits_{k=0}^{2s}c_kh^k=0,h=s,s-1,\cdots,-(s-1),-s\end{cases}$$

Using 2s+1 spin helicity functions is expected to solve the linear independence problem of the above two algebras. And completeness can be proven.

2 Basic expansion

3.1.3 Mathematical induction proof of general term formula for $\sigma^\alpha(s)[\sigma(s)\cdot\hat{p}]^n\sigma_\alpha(s)$

Thm. 3.1.1. $\sigma^\alpha(s)[\sigma(s)\cdot\hat{p}]^n\sigma_\alpha(s)=\sum\limits_{k=0}^{[n/2]}[C_n^{2k}\sigma^2(s)-C_{n+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{n-2k}, n\geq 0$

Proof:
Use mathematical induction to prove this theorem.
Step 1: When $i=0$, the following is established.

$\sigma^\alpha(s)[\sigma(s)\cdot\hat{p}]^0\sigma_\alpha(s)=\sum\limits_{k=0}^{[0/2]}[C_0^{2k}\sigma^2(s)-C_{0+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{0-2k}$

Step 2: Assume when $i<=n$, the following is established.

$\sigma^\alpha(s)[\sigma(s)\cdot\hat{p}]^i\sigma_\alpha(s)=\sum\limits_{k=0}^{[i/2]}[C_i^{2k}\sigma^2(s)-C_{i+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{i-2k}, 0\leq i\leq n$

Step 3: When $i=n+1$, $\sigma(s)\cdot\{[\sigma(s)\cdot\hat{p}]^{n+1}\sigma(s)\}$

$=-\{[\sigma(s)\cdot\hat{p}]^{2-(n+1)\%2}-[1-(n+1)\%2]\sigma^2(s)\}-\sum\limits_{l=0}^{n}C_{n+1}^{l}\{\sigma(s)\cdot\{[\sigma(s)\cdot\hat{p}]^l\sigma(s)\}\}[-\sigma(s)\cdot\hat{p}]^{n+1-l}$

$=-\{[\sigma(s)\cdot\hat{p}]^{2-(n+1)\%2}-[1-(n+1)\%2]\sigma^2(s)\}-\sum\limits_{l=0}^{n}C_{n+1}^{l}\sum\limits_{k=0}^{[l/2]}[C_l^{2k}\sigma^2(s)-C_{l+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{l-2k}[-\sigma(s)\cdot\hat{p}]^{n+1-l}$

$=-\{[\sigma(s)\cdot\hat{p}]^{2-(n+1)\%2}-[1-(n+1)\%2]\sigma^2(s)\}-\sum\limits_{l=0}^{n}\sum\limits_{k=0}^{[l/2]}(-1)^{n+1-l}C_{n+1}^{l}[C_l^{2k}\sigma^2(s)-C_{l+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{n+1-2k}$

$=-\{[\sigma(s)\cdot\hat{p}]^{2-(n+1)\%2}-[1-(n+1)\%2]\sigma^2(s)\}+\sum\limits_{k=0}^{[n/2]}\sum\limits_{l=2k}^{n}(-1)^{n-l}C_{n+1}^{l}[C_l^{2k}\sigma^2(s)-C_{l+1}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{n+1-2k}$

$=\sum\limits_{k=0}^{[(n+1)/2]}[C_{n+1}^{2k}\sigma^2(s)-C_{n+2}^{2(k+1)}][\sigma(s)\cdot\hat{p}]^{n+1-2k}$

This step proves that when $i=n+1$, it is established.
Step 4: Based on the above inductive reasoning, the proposition is established, and the theorem is proved. □

Proof:
Use mathematical induction to prove this theorem.
Step 1: When $i = 0$, the following is established.
$i^{-1}\sigma(s)\times\{[\sigma(s)\cdot\hat{p}]^0\sigma(s)\} = \sum_{k=0}^{[0/2]}\{(C_0^{2k+1} + C_0^{2k+2})[\sigma(s)\cdot\hat{p}]\sigma(s) + (C_0^{2k} - C_0^{2k+2})\sigma(s)[\sigma(s)\cdot\hat{p}] - C_0^{2k+1}\sigma^2(s)\hat{p}\}[\sigma(s)\cdot\hat{p}]^{0-2k-1}$
Step 2: Assume when $0 \leq l \leq n$, the following is established.
$i^{-1}\sigma(s)\times\{[\sigma(s)\cdot\hat{p}]^l\sigma(s)\} = \sum_{k=0}^{[l/2]}\{(C_i^{2k+1} + C_i^{2k+2})[\sigma(s)\cdot\hat{p}]\sigma(s) + (C_i^{2k} - C_i^{2k+2})\sigma(s)[\sigma(s)\cdot\hat{p}] - C_i^{2k+1}\sigma^2(s)\hat{p}\}[\sigma(s)\cdot\hat{p}]^{i-2k-1}$

10 Isomorphism of lower order expansion coefficients for $[\sigma(s)\cdot\hat{p}]^{2s+1}$

10.1 An important recursive relationship

Lem. 10.1.1. $[\sigma(s)\cdot\hat{p}]^{2s+3}=\sum_{k=1}^{n}[X_1(s)X_k(s)+X_{k+1}(s)][\sigma(s)\cdot\hat{p}]^{2s+1-2k}$

Thm. 10.1.1.
$[\sigma(s-1)\cdot\hat{p}]^{2s+1}=\sum_{k=1}^{[s+1/2]}X_k(s)[\sigma(s-1)\cdot\hat{p}]^{2s+1-2k}\Leftrightarrow X_{k+1}(s)=X_{k+1}(s-1)-s^2X_k(s-1)$
$;[\sigma(s)\cdot\hat{p}]^{2s+1}=\sum_{k=1}^{[s+1/2]}X_k(s)[\sigma(s)\cdot\hat{p}]^{2s+1-2k},X_1(s)=\frac{1}{4}C_{2s+2}^{3},X_{[s+1/2]}(s-1):=0,k=1,\cdot\cdot,[s-1/2]$

Proof: $[\sigma(s-1)\cdot\hat{p}]^{2s+1}=\sum_{k=1}^{[s+1/2]}X_k(s)[\sigma(s-1)\cdot\hat{p}]^{2s+1-2k}$

$\Leftrightarrow[\sigma(s-1)\cdot\hat{p}]^{2s+1}=X_1(s)[\sigma(s-1)\cdot\hat{p}]^{2s-1}+\sum_{k=2}^{[s+1/2]}X_k(s)[\sigma(s-1)\cdot\hat{p}]^{2s+1-2k}$

$\Leftrightarrow[\sigma(s-1)\cdot\hat{p}]^{2s+1}=X_1(s)[\sigma(s-1)\cdot\hat{p}]^{2s-1}+\sum_{k=1}^{[s-1/2]}X_{k+1}(s)[\sigma(s-1)\cdot\hat{p}]^{2s-1-2k}$

11.6 Sorting out the reasoning process

First of all, there is the following conjecture: It can be proved by using polynomial expansion theorem and natural number splitting method. However, only in the lower order case it has strictly proved, and the general case is still a conjecture. This conjecture has not been strictly proved and others can be strictly proved.

Ass. 11.6.1. $[\sigma(s) \cdot \hat{p}]^{2s+1} = \sum_{k=1}^{[s+1/2]} X_k(s)[\sigma(s) \cdot \hat{p}]^{2s+1-2k}$

With the above conjectures, one is that $X_k(s)$ can be directly obtained through linear algebraic methods. However, it is only strictly solved in the lower order case. And in general, it is still guessed. The other is to strictly obtain the recurrence relationship through the above reasoning. And the

coefficients can be completely and strictly solved. The following two corollaries of isomorphism: One is that it can be completely inferred from the above conjectures and coefficients. Second, it can be inferred from advanced representation transformation technology. However, the coefficients cannot be derived concretely.

Cor. 11.6.1. $[\sigma(s-l)\cdot\hat{p}]^{2s+1} = \sum_{k=1}^{[s+1/2]} X_k(s)[\sigma(s-l)\cdot\hat{p}]^{2s+1-2k}, l = 0, 1, \cdots, [s+1/2]$

Chapter17 Quasidifferential Operators and Matrix Continuous Products

1 Establishment of new mathematical tools

1.1 Introduction of special quasidifferential operators

Plane wave solution hypothesis: Assume that all plane wave solutions satisfying the massless particle physics equation do not contain zero frequency solutions. Therefore, the constant solution is not a plane wave solution of the massless particle equation. And it should be treated separately.

Def. 1.1.1. $f(\vec{r},t) := \int\limits_{\vec{p}\neq 0} f(\vec{p},t)e^{i\vec{p}\cdot\vec{r}}d^3\vec{p}$

Def. 1.1.2. $\begin{cases} \frac{1}{\sqrt{m^2-\nabla^2}}f(\vec{r},t) := \frac{1}{(2\pi)^3}\int \frac{1}{E}f(\vec{p},t)e^{i\vec{p}\cdot\vec{r}}d^3\vec{p}, \forall f(\vec{r},t) \\ \sqrt{m^2-\nabla^2}f(\vec{r},t) := \frac{1}{(2\pi)^3}\int Ef(\vec{p},t)e^{i\vec{p}\cdot\vec{r}}d^3\vec{p}, \forall f(\vec{r},t) \end{cases}$ $\sqrt{m^2-\nabla^2} \longleftrightarrow E = \sqrt{m^2+\vec{p}^2}$

Def. 1.1.3. $\begin{cases} \frac{1}{\sqrt{-\nabla^2}}f(\vec{r},t) := \frac{1}{(2\pi)^3}\int \frac{1}{|\vec{p}|}f(\vec{p},t)e^{i\vec{p}\cdot\vec{r}}d^3\vec{p}, \forall f(\vec{r},t) \\ \sqrt{-\nabla^2}f(\vec{r},t) := \frac{1}{(2\pi)^3}\int |\vec{p}|f(\vec{p},t)e^{i\vec{p}\cdot\vec{r}}d^3\vec{p}, \forall f(\vec{r},t) \end{cases}$ $\sqrt{-\nabla^2} \longleftrightarrow |\vec{p}|$

Self comment: The above Dirac matrix continuous product expansion is based on the specific calculation results of the previous items. And then it is summed up and reasonably guessed out. Essentially, it has not been strictly proven, and there will be time to supplement it later. Although the above can be written strictly, concretely, and completely step by step, the writing method is not compact enough. It is not easy to conveniently use. We must think of a good way to express it, and then we can use it conveniently.

Although the above method of writing has become more compact, it can be strictly, concretely, and completely written step by step. However, it is still not concise enough to be easily used. We must think of a better way to express it for conveniently using.

The potential commutation rule can be calculated from the field commutation rule through the Q product. n principle, it can be used to strictly prove the Behrends-Frontsdal conjecture formula. But it is very cumbersome and difficult to use. In fact, it is still difficult to prove the Behrends-Frontsdal conjecture formula.

Chapter18 Quantization of Non Relativistic Particles

1 Fourier analysis technique and plane wave solutions expansion [37]

1.1 Fourier expansion of wave function

Basic idea: The wave function is completely and uniquely expanded according to Fourier analysis. The equations and constraints are considered as conditions for selecting wave functions. The final result is a complete plane wave solutions that conforms to the equations and constraints.

Def. 1.1.1. $k \equiv (\vec{k}, iE), x \equiv (\vec{r}, it), d^4x \equiv d^3\vec{r}dt, \omega_k \equiv \sqrt{\vec{k}^2 + m^2} > 0, p_a(\omega_k) \equiv (\vec{k}, i\omega_k)_a$

Def. 1.1.2. $\int\limits_{\vec{r}=-\infty}^{+\infty} \equiv \int\limits_{r_x=-\infty}^{+\infty} \int\limits_{r_y=-\infty}^{+\infty} \int\limits_{r_z=-\infty}^{+\infty}, \quad \int\limits_{x=-\infty}^{+\infty} \equiv \int\limits_{r_x=-\infty}^{+\infty} \int\limits_{r_y=-\infty}^{+\infty} \int\limits_{r_z=-\infty}^{+\infty} \int\limits_{t=-\infty}^{+\infty}$

Def. 1.1.3. $\int\limits_{\vec{k}=-\infty}^{+\infty} \equiv \int\limits_{p_x=-\infty}^{+\infty} \int\limits_{p_y=-\infty}^{+\infty} \int\limits_{p_z=-\infty}^{+\infty}, \quad \int\limits_{k=-\infty}^{+\infty} \equiv \int\limits_{p_x=-\infty}^{+\infty} \int\limits_{p_y=-\infty}^{+\infty} \int\limits_{p_z=-\infty}^{+\infty} \int\limits_{E=-\infty}^{+\infty}$

Fourier expansion of the wave function:

$$\phi(\vec{r}, t) = \frac{1}{(2\pi)^{3/2}} \int\limits_{\vec{k}=-\infty}^{+\infty} \int\limits_{E=-\infty}^{+\infty} \Phi(\vec{k}, E) e^{i(\vec{k}\cdot\vec{r}-Et)} d^3\vec{k}dE, \Phi(\vec{k}, E) = \frac{1}{(2\pi)^{3/2}} \int\limits_{\vec{r}=-\infty}^{+\infty} \int\limits_{t=-\infty}^{+\infty} \phi(\vec{r}, t) e^{-i(\vec{k}\cdot\vec{r}-Et)} d^3\vec{r}dt$$

The Fourier expansion compact form of the wave function:

$$\phi(x) = \frac{1}{(2\pi)^{3/2}} \int\limits_{k=-\infty}^{+\infty} \Phi(k) e^{ik\cdot x} d^4k \Leftrightarrow \Phi(k) = \frac{1}{(2\pi)^{3/2}} \int\limits_{x=-\infty}^{+\infty} \phi(x) e^{-ik\cdot x} d^4x \tag{18.1}$$

1.2 Fourier expansion of wave function and Lorentz covariance

Def. 1.2.1. $\Phi(k) \equiv \frac{1}{(2\pi)^{3/2}} \int\limits_{x=-\infty}^{+\infty} \phi(x) e^{-ik\cdot x} d^4x, \Phi'(k') \equiv \frac{1}{(2\pi)^{3/2}} \int\limits_{x'=-\infty}^{+\infty} \phi'(x') e^{-ik'\cdot x'} d^4x'$

The above two expressions are mathematically just two arbitrary definitions. It can have arbitrary mathematical meanings, but it can be given explicit physical meanings. Think of the former as an expression in the reference system O and the latter as an expression in the reference system O'. Specifically, consider x as the expression of space-time coordinates in the reference system O. Consider k as an expression of four dimensional momentum in the reference system O. Consider $\phi(x)$ as an expression of the space-time wave function in the reference system O. Consider $\Phi(k)$ as an expression of the momentum phase spatial wave function in the reference system O. consider x' as the expression of space-time coordinates in the reference system O'. Consider k' as an expression of four dimensional momentum in the reference system O'. Consider $\phi(x')$ as an expression of the space-time wave function in the reference system O'. Consider $\Phi(k')$ as an expression of the momentum phase spatial wave function in the reference system O'. The physical quantity in the reference system O' is associated with the corresponding physical quantity in the reference system O through the Lorentz transformation. In this connection, $k \cdot x, d^4x$ are represented as scalars. ,$\phi(x), \Phi(k)$ are represented as covariates.

Thm. 1.2.1. $\phi'(e^{\varepsilon}x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x) \Leftrightarrow \Phi'(e^{\varepsilon}k) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$

Proof: $\phi'(e^{\varepsilon}x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x)$

$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int\limits_{x=-\infty}^{+\infty} \phi'(e^{\varepsilon}x) e^{-ik\cdot x} d^4x = \frac{i}{(2\pi)^{3/2}} \int\limits_{x=-\infty}^{+\infty} e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\phi(x) e^{-ik\cdot x} d^4x$

$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int\limits_{e^{-\varepsilon}x'=-\infty}^{+\infty} \phi'(x') e^{-ike^{-\varepsilon}\cdot x'} d^4x' = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$

$\Leftrightarrow \frac{i}{(2\pi)^{3/2}} \int\limits_{x'=-\infty}^{+\infty} \phi'(x') e^{-ike^{-\varepsilon}\cdot x'} d^4x' = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$

$\Leftrightarrow \Phi'(e^{\varepsilon}k) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(k)$ □

The above theorem shows: If the spatiotemporal wave function is a covariate, then its Fourier expansion coefficients are all covariates of the same type, and vice versa. The above conclusion is mathematically equivalent to make a variable substitution $x' = e^{\varepsilon}x, k' = e^{\varepsilon}k$, and meet $\Phi'(e^{\varepsilon}x) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}\Phi(x)$. This transformation is just the Lorentz transformation.

Math Skills: I only provide key skills here and not provide a complete proof. In Weinberg's book, using the conservation equation of current sources, the property of physical functions being zero at infinite distance in space, and the invariance of physical time under Lorentz transformation, Lorentz covariance of Q, P^a, M^{ab} can be proved from the above proposition.

Here, a different approach is used than in ordinary books. Four-dimensional rather than three-dimensional Fourier expansion is used. Clearly showing the physical concepts of particles in and out of the shell. Lorentz covariance is also evident in it, and includes a new algebraic solution for Dirac function solutions. In the process of proof, we also saw the decomposition of positive and negative energy solutions. And the negative energy solution can be understood in two meanings: one is to understand the negative energy solution as a negative mass particle, and the other is to understand the negative energy solution as a positive mass particle. However, the negative energy solution should be understood as a reflected wave and the positive energy solution should be understood as an incident wave.

Cor. 3.1.1. $a'(e^{\varepsilon}[\vec{k},E])\delta(E^2 - \vec{k}^2 - m^2) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}a(\vec{k},E)\delta(E^2 - \vec{k}^2 - m^2)$
$\Rightarrow a'(e^{\varepsilon}[\vec{k},\omega_k]) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}a(\vec{k},\omega_k), a'(e^{\varepsilon}[\vec{k},-\omega_k]) = e^{\frac{i}{2}\varepsilon^{ab}S_{ab}}a(\vec{k},-\omega_k)$

Cor. 3.1.2. $a(\vec{k},E)\delta(E^2 - \vec{k}^2 - m^2) = \frac{1}{2\omega_k}a(\vec{k},E)[\delta(E-\omega_k) + \delta(E+\omega_k)], |\vec{k}| << m$
$\approx \frac{1}{2(m+\frac{\vec{k}^2}{2m})}[a(\vec{k},m+\frac{\vec{k}^2}{2m})\delta(E-m-\frac{\vec{k}^2}{2m}) + a(\vec{k},-m-\frac{\vec{k}^2}{2m})\delta(E+m+\frac{\vec{k}^2}{2m})]$

From the above, it can be seen that under the non relativistic limit, the plane wave solutions of a complex scalar field is divided into two non relativistic positive and negative particles. They can exist simultaneously. This can be analyzed further. Can we prove that the positive and negative energy solutions are independently conserved?

From the above, under the non relativistic limit, the positive and negative energy branchs for Schrodinger equation both describe a non relativistic particle. They can't describe two positive and negative particles simultaneously. If they appear in the same equation, they become zero. It makes no sense. And the conjugate solution of a positive energy branch is the solution of a negative energy

branch, and vice versa. The conjugation of positive particle characterizes an antiparticle. In addition from the proof of the above two theorems, it can be seen that the two branches can been uniformly expressed only by assuming that m can take a positive or negative value. Then the negative energy branch is same as a positive energy branch in form. $m > 0$ describes a positive branch, and $m < 0$ describes a negative branch. There are two understandings on negative energy solutions, one describe particles with a negative mass, and the other describe particles with a positive mass. Quantized solution with a negative mass is equivalent to positive energy solution.

The meaning of this quantum state is as follows: every mathematical point in the momentum space $\vec{k}_i$ corresponds to an energy level. This energy level is filled with n_i particles with mass m and momentum $\vec{k}_i$. There are infinite similar energy levels. Because the total number of physical particles is limited, the number of particles at many energy levels is zero. This quantum state represents a distribution of multiple particles in the momentum space, and the total number of particles in each quantum state is variable. It is a common eigenstate of particle number operators and energy momentum operators.

Chapter19 Quantization of Majorana Particle and Neutrino

Self comment: Because most books on quantum field theory do not discuss the quantization of Majorana particles and neutrinos in detail and I have never found the corresponding content. In order to make up for this shortcoming, I decided to derive calculations by myself. In this chapter, I first give the quantization of Dirac particles by using Lorentz push transformation. And then I give detailed quantization details of Majorana particles and neutrinos.

1 Application of Lorentz boost transform: Solving plane waves of Dirac equation [25, 26]

1.1 Lorentz boost transformation of Dirac equation under general representation

Dirac equation:

Def. 1.1.1. $(\gamma^a \partial_a + m)\psi = 0, \gamma^a p_a = \gamma \cdot \vec{p} + \gamma_4 iE, E = \sqrt{\vec{p}^2 + m^2} > 0$

Dirac spinor boost transformation:

Cor. 1.1.1. $D_{\vec{v}} = e^{-ln[\gamma_v(1+v)]\hat{v}\cdot(\frac{i}{2}\vec{\gamma}\gamma_4)} = \frac{1+\gamma_v - i\gamma_v \vec{v}\cdot\vec{\gamma}\gamma_4}{\sqrt{2(\gamma_v+1)}} = \frac{E+m-i\vec{p}\cdot\vec{\gamma}\gamma_4}{\sqrt{2m(E+m)}} = \frac{m-i\gamma^a p_a \gamma_4}{\sqrt{2m(E+m)}}$

Properties of Dirac spinor Lorentz boost transformation factor:

Pro. 1.1.1. $(m - i\gamma^a p_a \gamma_4)^+ = (m - i\gamma^a p_a \gamma_4)$

Pro. 1.1.2. $(m - i\gamma^a p_a \gamma_4)^+ \gamma_4 (m - i\gamma^a p_a \gamma_4) = 2m(E + m)\gamma_4$

Pro. 1.1.3. $(E + m + i\vec{p} \cdot \vec{\gamma}\gamma_4)(E + m - i\vec{p} \cdot \vec{\gamma}\gamma_4) = 2m(E + m)$

Pro. 1.1.4. $(m - i\gamma^a p_a \gamma_4)^+ (m - i\gamma^a p_a \gamma_4) = 2(E + m)(E - i\vec{p} \cdot \vec{\gamma}\gamma_4)$

Pro. 1.1.5. $(m + i\gamma^a p_a \gamma_4)^+ (m - i\gamma^a p_a \gamma_4) = 2m^2 - 2E(E - i\vec{p} \cdot \vec{\gamma}\gamma_4)$

1.2 Static and kinematic solutions of Dirac equation under general representation

Static electron solution:

Under the representation transformation, the annihilation production operator and its commutation relationship are scalar and invariant. The system energy momentum operator and the conserved charge are also scalars and invariants. The wave function operator and its commutation relationship are representational covariates.

4 Equivalence between Majorana equation and massive neutrino equation

4.1 Equivalent anticommutative relations of Majorana and massive neutrino equation

Cor. 5.3.2. $a_\varsigma^+(\vec{p},h)=\frac{1}{(2\pi)^{3/2}}\sqrt{\frac{E}{2m}}\int[\eta^T(\vec{p},h)\nu^*(\vec{r},t)-(-1)^{h-\frac{1}{2}}e^{2i\theta}\eta^+(\vec{p},-h)\nu(\vec{r},t)]e^{i\varsigma(\vec{p}\cdot\vec{r}-Et)}d^3\vec{r}$

By using the above two coefficient expansions, it is easy to directly derive the following canonical commutative relation.

Cor. 5.3.3. $\begin{cases}\{\nu_{A_\varsigma}(\vec{r},t),\nu_{A'_\varsigma}^+(\vec{r}',t)\}=\delta_{A_\varsigma A'_\varsigma}\delta^3(\vec{r}-\vec{r}')\\\{\nu_{A_\varsigma}(\vec{r},t),\nu_{A'_\varsigma}(\vec{r}',t)\}=0\\\{\nu_{A'_\varsigma}^+(\vec{r},t),\nu_{B'_\varsigma}^+(\vec{r}',t)\}=0\end{cases}\Rightarrow\begin{cases}\{a_\varsigma(\vec{p},h),a_\varsigma^+(\vec{p}',h')\}=\delta_{hh'}\delta^3(\vec{p}-\vec{p}')\\\{a_\varsigma(\vec{p},h),a_\varsigma(\vec{p}',h')\}=0\\\{a_\varsigma^+(\vec{p},h),a_\varsigma^+(\vec{p}',h')\}=0\end{cases}$

Now, in turn, we can directly derive the following canonical commutative relation by using the wave function expansion.

7.4 Self consistency of s-spin equation and quantum Lorentz invariance

Cor. 7.4.1. $[s\partial_a + iS_{ab}(s,\varsigma)\partial^b]\psi(\vec{r},t) = 0 \overset{s=\frac{1}{2}}{\Leftrightarrow} -i\partial_a\psi(\vec{r},t) = [\psi(\vec{r},t), P_a]; \begin{cases}\{\psi_A(\vec{r},t), \psi^+_B(\vec{r}',t)\} = \delta_{AB}\delta^3(\vec{r}-\vec{r}')\\ \{\psi_A(\vec{r},t), \psi_B(\vec{r}',t)\} = 0\\ \{\psi^+_A(\vec{r},t), \psi^+_B(\vec{r}',t)\} = 0\end{cases}$

This scheme is self consistent only when the spin is $\frac{1}{2}$. So only neutrino can be quantized according to this scheme. Other spin particles cannot be quantized in this way, so they are excluded.

For a boson field, the equation of motion in classical theory is identical to the operator equation in quantum theory in form. But the physical meaning is different. The former can be regarded as the classical limit or quantum average of the latter. he equations of motion in classical theory can be written in Poisson bracket form, but cannot be written in commutator form.(Actually, it is zero, which is inconsistent with the equation of motion.)he operator equation of quantum theory can be written in either Poisson bracket form or the commutator form. That is, Poisson brackets in the form of operators are equivalent to commutators.

Here, a different approach is used than in ordinary books. Four-dimensional rather than three-dimensional Fourier expansion is used. Clearly show the physical concepts of particles in and out of the shell. Lorentz covariance is also evident in it. And it includes a new algebraic solution on the Dirac function. In the process of proof, we also saw the decomposition of positive and negative energy solutions. And the negative energy solution can be understood in two meanings: one is to understand the negative energy solution as a negative mass particle, and the other is still to understand the negative energy solution as a positive mass particle. However, the negative energy solution should be understand as a reflected wave, the positive energy solution should be understood as an incident wave.

Cor. 1.3.1. $a'(e^{\varepsilon}[\vec{k},E])\delta(E^2-\vec{k}^2-m^2) = e^{\frac{1}{2}\varepsilon^{ab}S_{ab}}a(\vec{k},E)\delta(E^2-\vec{k}^2-m^2)$

From the above, Under the non relativistic limit, the plane wave solution of a complex scalar field is divided into two non relativistic positive and negative particles. They can exist simultaneously. This can be analyzed further. Can we prove that the positive and negative energy solutions are independently conserved?

From the above formula, only when $1\pm1=0$ the micro causality can be satisfied. Only when $\delta_\sigma\geq0$, the probability nonnegativity is satisfied. Therefore, among various covariant commutative or anticommutative schemes in mathematics, there is only one physically reasonable scheme: That is, $\delta_\sigma=1$.(If equality between scalar fields is required, then if it is not 1, it can be uniformly normalized.) And it satisfies the commutative relation. here are actually two other types. That is $\delta_\sigma=0$. And it satisfies the commutative or anticommutative relation, which is just the classic case.

Chapter21 New Scheme for Covariant Quantization of Electromagnetic Field

This chapter mainly derives a new scheme for the covariant quantization of electromagnetic field strength from the traditional scheme for the quantization of electromagnetic field potential. It mainly reflects the export process, but does not reflect its integrity. he main purpose is to verify the correctness of the new covariate program. The following chapters will directly and separately give their complete field strength covariant quantization schemes under two representations.

1 Gauge potential analysis of electromagnetic field equation [22, 24]

1.1 Gauge potential description of electromagnetic field equation with mass

Thm. 1.1.1. $\begin{cases}\nabla\cdot\vec{E}=m^2\phi-\rho,\nabla\times\vec{E}=-\partial_t\vec{B}\\ \nabla\cdot\vec{B}=0,\nabla\times\vec{B}=m^2\vec{A}-\vec{J}+\partial_t\vec{E}\\ \nabla\cdot\vec{J}+\partial_t\rho=0\\ \vec{E}=-\partial_t\vec{A}-\nabla\phi,\vec{B}=\nabla\times\vec{A}\end{cases}\Leftrightarrow\begin{cases}(\nabla^2-\partial_t^2-m^2)\phi=\rho\\ (\nabla^2-\partial_t^2-m^2)\vec{A}=\vec{J}\\ \nabla\cdot\vec{A}+\partial_t\phi=0\\ \vec{E}=-\partial_t\vec{A}-\nabla\phi,\vec{B}=\nabla\times\vec{A}\end{cases}$

1.2 General gauge potential description of electromagnetic field equation

Lem. 1.2.1. $\nabla\times(\nabla\times\vec{A})=\nabla(\nabla\cdot\vec{A})-\nabla^2\vec{A}$

Lem. 1.2.2. $\nabla\cdot\vec{B}=0,\vec{A}=\frac{\nabla\times\vec{B}}{-\nabla^2}+\nabla\theta\Leftrightarrow\vec{B}=\nabla\times\vec{A},\nabla\cdot\vec{A}=\nabla^2\theta$

Positive proof:

Proof: $\nabla\cdot\vec{B}=0,\vec{A}=\frac{\nabla\times\vec{B}}{-\nabla^2}+\nabla\theta$
$\Rightarrow\nabla\times\vec{A}=\frac{\nabla\times(\nabla\times\vec{B})}{-\nabla^2}+\nabla\times\nabla\theta,\nabla\cdot\vec{A}=\frac{\nabla\cdot(\nabla\times\vec{B})}{-\nabla^2}+\nabla\cdot\nabla\theta$

$\Rightarrow\vec{B}=\nabla\times\vec{A},\nabla\cdot\vec{A}=\nabla^2\theta$ □

Reverse proof:

And scalar potential $\tilde{\phi}(x)$ and source $J_a(x)$ is a c-number relative to the electromagnetic field, not an operator. In this sense we know that the scalar potential, that is, the electrostatic field cannot be quantized because it is not even an operator.

It can be seen from the above that the constraint conditions of the electromagnetic field equation are incompatible with the covariant commutative relations. How to reasonably reselect the commutative relations of the additional introduced ϕ to solve this problem. Although traditionally, constraints are not considered as operator equations, rather as a selection of physical states. But this is not natural. Therefore it is necessary to seek a more reasonable potential covariant scheme.

It can be seen from the above that the guage condition is incompatible with a commutative relation. Incompatibility essentially stems come from non physical introduction of ϕ.

If the gauge condition is no longer viewed as an operator equation, but as a choice of physical states, the equation and the commutative relations will be completely compatible. And there will be no contradiction. Where $\lambda = 1$ is the Feynman guage, and $\lambda = \infty$ is the Landau guage.

2.3 Analysis and discussion on potential solution of electromagnetic field equation

Def. 2.3.1. $\partial^aF_{ab}=0,F_{ab}=\partial_aA_b-\partial_bA_a$

If you get a solution A_a, then $A_a+\partial_a\theta$ is also another solution. Due to the arbitrariness of θ, the electromagnetic field equation has infinite sets of potential solutions. But the infinite potential solutions only correspond to the same solution F_{ab}. If the gauge is fixed, it is equivalent to select a solution A_a from an infinite number of potential solutions. In this way, there is no redundant potential solution, and at this time, it can correspond to the field strength solution F_{ab} one by one. Considering the completeness of the solution, for the complete field strength solution F_{ab}, which can be completely obtained by an incomplete potential solution A_a. And this incomplete potential solution A_a can also be completely obtained by a complete field strength solution F_{ab}. At this time, the complete field strength solution F_{ab} and the incomplete potential solution A_a are one-to-one correspondent. At this point, the electromagnetic field spin equation is completely equivalent to the electromagnetic field potential equation with gauge condition.
