Part I Thermodynamics and Fluctuations Far from Equilibrium

1 Introduction to Part I 3
1.1 Some Basic Concepts and Definitions 4
1.2 Elementary Thermodynamics and Kinetics 7
References 10

2 Thermodynamics Far from Equilibrium: Linear and Nonlinear One-Variable Systems 11
2.1 Linear One-Variable Systems 11
2.2 Nonlinear One-Variable Systems 12
2.3 Dissipation 15
2.4 Connection of the Thermodynamic Theory with Stochastic Theory 16
2.5 Relative Stability of Multiple Stationary Stable States 18
2.6 Reactions with Different Stoichiometries 20
References 21

3 Thermodynamic State Function for Single and Multivariable Systems 23
3.1 Introduction 23
3.2 Linear Multi-Variable Systems 25
3.3 Nonlinear Multi-Variable Systems 29
References 32

4 Continuation of Deterministic Approach for Multivariable Systems 33
References 39

5 Thermodynamic and Stochastic Theory of Reaction–Diffusion Systems 41
5.1 Reaction–Diffusion Systems with Two Intermediates 44
5.1.1 Linear Reaction Systems 45
5.1.2 Non-Linear Reaction Mechanisms 47
5.1.3 Relative Stability of Two Stable Stationary States of a Reaction–Diffusion System 49
5.1.4 Calculation of Relative Stability in a Two-Variable Example, the Selkov Model 52
References 58

6 Stability and Relative Stability of Multiple Stationary States Related to Fluctuations 59
References 64

7 Experiments on Relative Stability in Kinetic Systems with Multiple Stationary States 65
7.1 Multi-Variable Systems 65
7.2 Single-Variable Systems: Experiments on Optical Bistability 68
References 71

8 Thermodynamic and Stochastic Theory of Transport Processes 73
8.1 Introduction 73
8.2 Linear Transport Processes 75
8.2.1 Linear Diffusion 75
8.2.2 Linear Thermal Conduction 77
8.2.3 Linear Viscous Flow 79
8.3 Nonlinear One-Variable Transport Processes 82
8.4 Coupled Transport Processes: An Approach to Thermodynamics and Fluctuations in Hydrodynamics 83
8.4.1 Lorenz Equations and an Interesting Experiment 83
8.4.2 Rayleigh Scattering in a Fluid in a Temperature Gradient 87
8.5 Thermodynamic and Stochastic Theory of Electrical Circuits 87
References 87

9 Thermodynamic and Stochastic Theory for Non-Ideal Systems 89
9.1 Introduction 89
9.2 A Simple Example 90
References 93

10 Electrochemical Experiments in Systems Far from Equilibrium 95
10.1 Introduction 95

10.2 Measurement of Electrochemical Potentials in Non-Equilibrium Stationary States 95
10.3 Kinetic and Thermodynamic Information Derived from Electrochemical Measurements 97
References 100

11 Theory of Determination of Thermodynamic and Stochastic Potentials from Macroscopic Measurements 101
11.1 Introduction 101
11.2 Change of Chemical System into Coupled Chemical and Electrochemical System 102
11.3 Determination of the Stochastic Potential ϕ in Coupled Chemical and Electrochemical Systems 104
11.4 Determination of the Stochastic Potential in Chemical Systems with Imposed Fluxes 105
11.5 Suggestions for Experimental Tests of the Master Equation 107
References 108

Part II Dissipation and Efficiency in Autonomous and Externally Forced Reactions, Including Several Biochemical Systems

12 Dissipation in Irreversible Processes 113
12.1 Introduction 113
12.2 Exact Solution for Thermal Conduction 113
12.2.1 Newton's Law of Cooling 113
12.2.2 Fourier Equation 114
12.3 Exact Solution for Chemical Reactions 116
12.4 Invalidity of the Principle of Minimum Entropy Production 118
12.5 Invalidity of the 'Principle of Maximum Entropy Production' 119
12.6 Editorial 119
References 119

13 Efficiency of Irreversible Processes 121
13.1 Introduction 121
13.2 Power and Efficiency of Heat Engines 122
References 129

14 Finite-Time Thermodynamics 131
Contributed by R. Stephen Berry
14.1 Introduction and Background 131
14.2 Constructing Generalized Potentials 133
14.3 Examples: Systems with Finite Rates of Heat Exchange 134
14.4 Some More Realistic Applications: Improving Energy Efficiency by Optimal Control 137

14.5 Optimization of a More Realistic System: The Otto Cycle 139
14.6 Another Example: Distillation 141
14.7 Choices of Objectives and Differences of Extrema 144
References 146

15 Reduction of Dissipation in Heat Engines by Periodic Changes of External Constraints 147
15.1 Introduction 147
15.2 A Simple Example 147
15.3 Some Calculations and Experiments 152
15.3.1 Calculations 152
15.3.2 Experiments 157
References 158

16 Dissipation and Efficiency in Biochemical Reactions 159
16.1 Introduction 159
16.2 An Introduction to Oscillatory Reactions 159
16.3 An Oscillatory Reaction with Constant Input of Reactants 163
References 168

17 Three Applications of Chapter 16 169
17.1 Thermodynamic Efficiency in Pumped Biochemical Reactions 169
17.2 Thermodynamic Efficiency of a Proton Pump 172
17.3 Experiments on Efficiency in the Forced Oscillatory Horse-Radish Peroxidase Reaction 174
References 179

Part III Stochastic Theory and Fluctuations in Systems Far from Equilibrium, Including Disordered Systems

18 Fluctuation–Dissipation Relations 183
References 188

19 Fluctuations in Limit Cycle Oscillators 191
References 195

20 Disordered Kinetic Systems 197
References 202
