1.0 Introduction

1.1 Project Description

The Tampa Hillsborough Expressway Authority (THEA) is conducting a Project Development and Environment (PD&E) Study to evaluate the needs, costs, and effects of extending Whiting Street and Washington Street, the reconfiguration of the Selmon Expressway on-ramps at Jefferson Street, the Selmon Expressway off-ramps at Florida Avenue and Channelside Drive. This study will examine the extension of Whiting Street and Washington Street to North Meridian Avenue and include improvements and re-alignment of the existing segment of Whiting Street from Jefferson Street to North Brush Street. These new connections are expected to provide improved traffic flow and enhance safety for all transportation modes and provide potential congestion relief on parallel facilities along the adjacent street network.

This analysis will also examine the reconfiguration of the Selmon Expressway on-ramps at Jefferson Street and the off-ramps at Florida Avenue and Channelside Drive. The proposed improvements will include the widening of the Florida Avenue off-ramp to two lanes, the elimination of the Channelside Drive off-ramp, and the inclusion of a new Whiting Street off-ramp connecting to the new Whiting Street alignment. This new connection from the Selmon Expressway aims to improve safety, traffic circulation and access to Whiting Street and N Meridian Avenue. Ultimately, this study will develop the alternatives to achieve these goals with an emphasis placed on operations, safety, and minimizing right of way impacts.

To best understand the unique shifts in travel patterns and demand associated with the Whiting Street PD&E Study, a detailed examination of the existing travel patterns of the facilities surrounding the proposed enhancements is required. **Figure 1** shows the project location of the Whiting Street PD&E Study. The project study area shown in **Figure 2.2**, covers roughly 0.2 square miles and is bounded by Florida Avenue from Channelside Drive to Whiting Street, east on Whiting Street from Florida Avenue to Jefferson Street, north on Jefferson Street from Whiting Street to Kennedy Avenue, east on Kennedy Avenue from Jefferson Street to Meridian Avenue, south along Meridian Avenue from Kennedy Avenue to Channelside Drive, and west along Channelside Drive from Meridian Avenue to Florida Avenue.

2.0 Existing Conditions

2.1 Traffic Data Collection

Traffic counts for this study were collected over a wide variety of ranges beginning in summer of 2019 and ending in February of 2020. A list of study date ranges and hours of observation for turning movement counts can be found in **Table 1**. A list of study date ranges and hours of observation for tube counts can be found in **Table 2**. A detailed list of all turning movement count locations and tube count locations are found in **Table 3** and **Table 4**. Raw data can be found in **Appendix B**. An analysis of the 48-hour and 72-hour counts was conducted to examine the study area wide AM and PM hours with the least variance from the individual count peak hours. Based on this screening, the AM peak hour occurred between 7:30 AM and 8:30 AM and the PM peak hour occurred between 4:30 PM and 5:30 PM.

Table 1: Turning Movement Data Collection Efforts

Collection ID	Data Collection Date	Count Type	Analysis Hours
A	5/21/2019	6-Hour TMC	6:30 AM to 9:30 AM, 4:00 PM to 7:00 PM
B	9/11/2019	6-Hour TMC	6:30 AM to 9:30 AM, 3:45 PM to 6:45 PM
C	9/17/2019	6-Hour TMC	6:30 AM to 9:30 AM, 3:45 PM to 6:45 PM
D	9/24/2019	6-Hour TMC	6:30 AM to 9:30 AM, 3:45 PM to 6:45 PM
E	12/10/2019	8-Hour TMC	7:00 AM to 10:00 AM, 11:00 AM to 1:00 PM, 3:00 PM to 6:00 PM
F	1/21/2020	12-Hour TMC	6:00 AM to 6:00 PM

Table 2: Tube Count Data Collection Efforts

Collection ID	Data Collection Dates	Count Type
G	5/14/2019 to 5/15/2019	48-hour
H	9/10/2019 to 9/12/2019	72-hour
I	9/17/2019 to 9/19/2019	72-hour
J	9/24/2019 to 9/26/2019	72-hour
K	2/25/2020 to 2/27/2020	72-hour

Table 3: Turning Movement Count Locations

Map ID	Collection ID	Description	Control Type
1	A	Channelside Drive and S Florida Avenue	Signalized

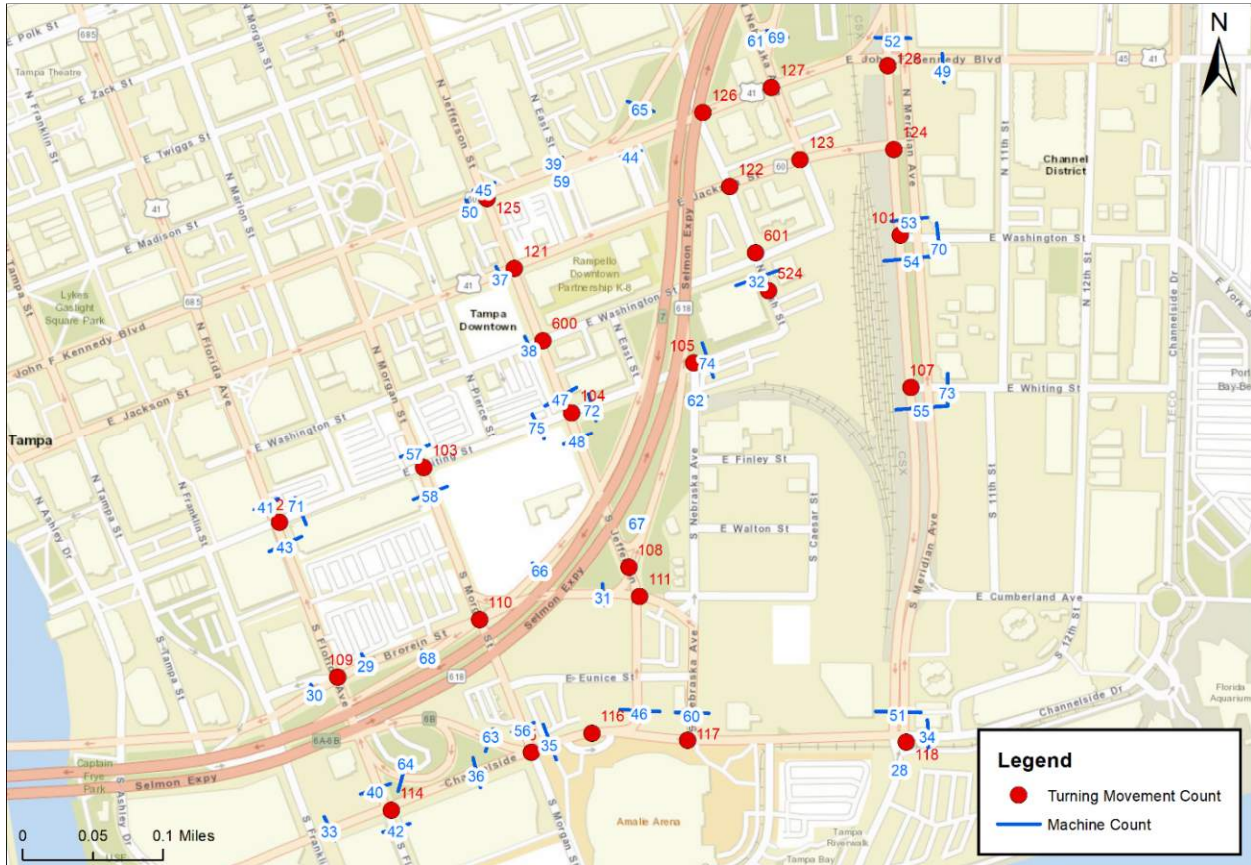

Figure 2: Traffic Count Locations

2.2 Development of Existing Year (2019) Traffic Volumes

This section discusses the development of the existing year (2019) design traffic volumes for the Whiting Street PD&E Study Area. The volumes were developed based on the collected traffic data and the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*.

2.2.1 Field Collected AADT

Existing year (2019) field collected annual average daily traffic (AADT) was computed by multiplying the two-day or three-day average of the 48-hour or 72-hour count data by seasonal and axle adjustment factors. The exception to this was on the Selmon Expressway where counts were not collected as part of this study effort and AADTs from Florida Traffic Online were used directly (COSITE 105249 west of Florida Avenue and COSITE 105277 north of Kennedy Boulevard). Seasonal and axle correction factors were downloaded from Florida Traffic Online for 2018, prior to the release of the 2019 data.

Table 5 summarizes the field collected existing year (2019) AADT volumes.

Table 5: Field Collected Existing Year (2019) AADT

* AADT volumes were rounded in accordance with the *Project Traffic Forecasting Handbook (2019)*.

2.2.2 Design Traffic Factors

This section presents the design traffic factors that were developed for this study. The factors were determined based on the collected traffic data, historically observed factors, and forecasted factors from the model. The factors were developed based on the procedures outlined in the FDOT’s *Project Traffic Forecasting Handbook (2019)*. These design traffic factors used in the development of the existing year (2019), opening year (2026), interim year (2036), and design year (2046) design traffic volumes.

2.2.2.1 Peak Hour Factor

The peak hour factor (PHF) represents the fluctuation in the arrival rate of traffic during the peak hour by converting the hourly volume into the flow rate for the peak 15-minute period. The PHF measured at each intersection within the study area was used for the existing year (2019) for the AM and PM peak hours. **Table 6** summarizes the existing AM and PM PHFs for the 26 intersections in the study area. During the AM peak hour, the PHF ranges from 0.47 to 0.99 with a weighted average of 0.92. During the PM peak hour, the PHF ranges from 0.78 to 0.96 with a weighted average of 0.95.

Table 6: Field Measured Peak Hour Factors

Intersection	Peak Hour Factor	
	AM Peak Hour	PM Peak Hour
Washington Street and Meridian Avenue	0.94	0.87
Whiting Street and Florida Avenue	0.95	0.95
Whiting Street and Morgan Street	0.95	0.78
Whiting Street and Jefferson Street	0.87	0.78
Whiting Street and Nebraska Avenue	0.78	0.85
Whiting Street and Meridian Drive	0.93	0.83
Selmon Expressway on-ramp from Jefferson Street	0.94	0.91
Brorein Street and Florida Avenue	0.99	0.93
Brorein Street and Morgan Street	0.96	0.84
Brorein Street and Jefferson Street	0.95	0.90
Channelside Drive at Florida Avenue	0.87	0.93
Channelside Drive at Morgan Street	0.88	0.94
Channelside Drive and Jefferson Street	0.89	0.96
Channelside Drive and Nebraska Avenue	0.97	0.84
Channelside Drive and Meridian Avenue/Beneficial Drive	0.96	0.86
Jackson Street at Jefferson Street	0.84	0.88
Jackson Street at Brush Street	0.90	0.91
Jackson Street at Nebraska Avenue	0.87	0.88
Jackson Street at Meridian Avenue	0.90	0.92
Kennedy Blvd at Jefferson Street	0.91	0.94
Kennedy Blvd at Brush Street	0.91	0.93
Kennedy Blvd at Nebraska Avenue	0.87	0.93
Kennedy Blvd at Meridian Avenue	0.95	0.88
Washington Street at Governor Street	0.47	0.92
Washington Street at Jefferson Street	0.76	0.85
Washington Street at Brush Street	0.74	0.78
Average	0.92	0.95

2.2.2.2 Peak-to-Daily Ratio

The peak-to-daily ratio represents the proportion of AADT occurring during the design hour.

Table 7 summarizes the percentage of the daily traffic volume (peak-to-daily ratio) that occurred during the AM and PM peak hours. The weighted average of the AM peak-to-daily ratio on surface streets is 11.9% percent. The weighted average of the PM peak-to-daily ratio on surface streets is 8.8 percent. Based on the FDOT's *Project Traffic Forecasting Handbook (2019)*, a standard peak-to-daily ratio of 9.0 percent is used for arterials and freeways in an urban area. The higher peak-to-daily ratios observed during the data collection would indicate heavy peaking conditions. The standard peak-to-daily ratio of 9.0 percent was used in the development of traffic volumes for the Whiting Street PD&E Study.

Table 7: Field Measured Peak-to-Daily Ratio

Location	AADT	AM Peak Hour		PM Peak Hour	
		Volume	Ratio	Volume	Ratio
Selmon Expressway					
West of Florida Avenue*	58,500		9.0%		9.0%

Surface Street Weighted Average			11.9%		9.7%

*FDOT's standard K value used directly on the Selmon Expressway

2.2.2.3 Directional Factor

The directional distribution (D) factor is the proportion of traffic traveling in the peak direction relative to the sum of the traffic volume in both directions during the design hour. The D factor was determined from FDOT Florida Traffic Online (2019) for the Selmon Expressway and calculated from the 48-hour or 72-hour bi-directional approach counts for each counted location within the study area. **Table 8** and **Table 9** summarize the AM and PM peak hour directional distribution percentages (D factors) for the Selmon Expressway and downtown Tampa study area. The D factor ranged from 50.1 percent to 88.5 percent during the AM peak hour and from 50.1 percent to 87.5 percent during the PM peak hour. Typically, these high D factors may be a cause for concern that the observed data is in error, however these facilities serve many trips commuting into the downtown area during the AM and out during the PM. Currently, trip generation in downtown Tampa during the week is driven by office jobs with typical hours of operation.

Table 8: Field Measured D Factors - AM Peak Hour

*Resulting D Factor after volume balancing procedures were conducted.

The balanced D factors shown above were used to develop the traffic volumes for the study area. In cases where the balanced D factors exceed the recommended D factors defined in the FDOT's *Project Traffic Forecasting Handbook (2019)*, then the maximum value of 67.1 percent was used for the surface streets and 61.2 percent was used for the Selmon Expressway.

2.2.2.4 Daily and Design Hour Truck Factors

No 48-hour or 72-hour classification counts were collected as a part of this study. Florida Traffic Online (FTO) was reviewed in the study area and Jackson Street and Kennedy Boulevard were identified as similar locations where classification counts were available. The recommended daily truck percentages are provided in **Table 10** below.

Table 10: Recommended Daily Truck Percentages

COSITE	Description	2019 T Factor	2019 DHT
101258	Jackson Street, east of Nebraska Avenue	2.3%	2.0%
105311	Jackson Street, east of Jefferson Street	2.0%	1.0%

105310	Kennedy Boulevard, west of Nebraska Avenue	2.3%	2.0%
Average		2.2%	2.0%

2.2.3 Existing Year (2019) Peak Hour Volumes

A review of the peak hour turning movement count data obtained at all study intersections and minor cross streets was conducted within the area of influence for the previously defined AM and PM peak hours. Volumes were tied to origin-destination (OD) level trip patterns and balanced statistically utilizing data smoothing principles supported by the FDOT's *Project Traffic Forecasting Handbook (2019)* and the Transportation Research Board's *National Cooperative Highway Research Program Report 765: Analytical Travel Forecasting Approaches for Project-Level Planning and Design*.

To support the creation of a study area-wide OD trip table, a detailed existing conditions network was constructed in PTV VISUM to include all surface streets, the Selmon Expressway and ramps. External zones were created at each peripheral link to the network and internal zones were created on each city block. **Figure 3** illustrates the roadway network and zonal structure.

Volumes were added to the external links based on field collected volume data. Volumes were added to the internal zones by parsing AM and PM peak hour volumes (produced from peak period volumes) from the Tampa Bay Regional Planning Model provided by THEA (TBRPM) to each zone based on proportions of number of parking spaces. Vehicle traffic generation in downtown Tampa is driven by parking spaces where users must often park and walk to their destination and so the number of trips generated in the travel demand model was parsed using these spaces rather than the ITE trip generation characteristics of the destinations themselves. The number of parking spaces was collected from information provided online by the Downtown Tampa Partnership and from aerial counts where necessary.

During balancing procedures, volumes at external zones were more rigidly maintained while volumes at internal zones were allowed to change based on balancing needs of the system because the external zone volumes were field collected data while the internal zones were based only on estimated data from the TBRPM. As an additional restriction on the existing volumes, AM and PM peak hour volumes at all external zones were checked to ensure the balanced volume was equal to or greater than the counted value. Additional information on this check can be found in the *Statistical Evaluation of Existing Volume Development* found in **Appendix C**. **Table 11** provides a description of the input zones and the balanced zone productions and attractions for each.

A detailed accounting of the statistical accuracy between the field collected turning movement volumes and the normalized existing conditions can be found in in **Appendix C**. The existing year (2019) lane geometry and balanced AM and PM peak hour volumes for the study intersections within the area of influence are graphically illustrated in **Appendix D** respectively. A review of observed and balanced peak hour volumes on the Selmon Expressway is provided in **Table 12**. This check of peak hour volumes will be conducted during each scenario to ensure reasonable growth. The balanced peak hour volumes are either the same or slightly higher than the observed peak hour volumes as a conservative approach.

Table 12: Observed and Balanced Peak Hour Volumes on Selmon Expressway Ramps

Location	Observed Volumes		Existing Year (2019) Balanced Volumes	
	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour
EB Off Ramp to Channelside Drive	199	100	249	104

WB Off Ramp to Kennedy Boulevard	1,001	987	1,030	991
EB On Ramp from Nebraska Avenue	158	401	170	503

2.2.4 Existing Year (2019) AADT

Existing year (2019) AADT was derived from the application of the standard peak-to-daily ratio (9.0 percent) to the maximum of the AM or PM bi-directional peak hour volumes and then rounded, as guided by the FDOT's *Project Traffic Forecasting Handbook (2019)*. The existing year (2019) AADT volumes and lane geometry for the Whiting Street PD&E Study Area are provided in **Appendix E**.

3.0 Development of Future Traffic

3.1 Description of Travel Demand Model

The travel demand model used for forecasting the Whiting Street PD&E is a modified version of the Tampa Bay Regional Planning Model v8.2 created for THEA with a base year of 2015 and a horizon year of 2040. This model was previously validated and provided by THEA.

3.2 Design Year (2046) Growth Rate Development

Model outputs from the Tampa Bay Regional Planning Model (TBRPM), provided by the THEA and validated for downtown Tampa were used to forecast volumes for the study area. This model is based on the TBRPM version 8.2 with enhancements for downtown Tampa. The model has a 2015 base year and a 2040 horizon year.

Recommended growth rates for each zone were developed using four context-specific methodologies identified in

Table 13 below. The method number defines the hierarchy to be used for defining which method to use for defining growth rates with method 1 being preferable and method 4 being less preferable. These methods all rely on established forecasting methods.

Table 13: Context-specific methods for defining growth rates

Method	Context	Description
1	Zone links exist within the TBRPM	Use TBRPM outputs to define growth rate using NCHRP methodologies
2	Zone link for a surface street does not exist within the TBRPM	Use a weighted average growth rate of surface streets from method 1
3	Zone corresponds to planned SPP development	No growth rate, trip generation for these developments found in the Comprehensive Downtown Channelside Traffic Study Technical Memorandum will be used for forecasts directly
4	Zone does not correspond to a roadway and is based on internal trip generation	The study area is in an urban core and well-built out. The major developments will be from SPP and so all other zones in the study area will be grown using Bureau of Economic and Business Research low population forecasts

To establish model growth rates, methods from NCHRP Report 765 defined in the 2019 FDOT Project Traffic Forecasting Handbook were used to smooth forecasted model volumes. A model 2019 AADT was interpolated between the 2015 base year and the 2040 horizon year and compared to the 2019 balanced volumes previously established. A recommended model growth rate was then defined between the smoothed 2040 model AADT and the balanced 2019 volumes. This growth rate was then applied to the balanced 2019 volume to derive design year (2046) AADT for all external network zones. **Table 14** below provides these recommended growth rates and design year (2046) AADTs for external network zones.

Table 14: Forecasts of External Network Links

Location	Model Outputs				Existing 2019 AADT	NCHRP Adjusted 2040 AADT	Recommended Growth Rate	2046 AADT
	2015 AADT	2019 AADT (Interpolated)	2040 AADT	Annual Growth

3.3 Development of Design Year (2046) Traffic Volumes

Design year (2046) traffic volumes were developed for both the no-build and build scenarios using the same inputs (productions and attractions from the zones). The only difference between the two scenarios is the roadway network. The no-build scenario will include roadway improvements which have been committed as part of the on-going downtown Tampa redevelopment from SPP. The build scenario will include additional roadway improvements to be assessed by this study.

AADTs developed through the forecasting process were used in conjunction with the K and D-factors, discussed in **Section 2.2.2**, to develop design year network inputs at each of the external zones. These network inputs are provided in **Table 15** below. The design year (2046) seed OD matrix was developed using the existing year (2019) OD matrix, developed during the course existing volume development in **Section 2.0**, and an OD matrix for the SPP development trips found in the THEA Comprehensive Downtown Channelside Traffic Study Technical Memorandum. The SPP trips OD matrix was developed by distributing the trips generated in the THEA Comprehensive Downtown Channelside Traffic Study Technical Memorandum using distribution patterns found in the TBRPM. A table of the trips generated by SPP, taken from the THEA Comprehensive Downtown Channelside Traffic Study Technical Memorandum, is found in **Appendix G**.

The existing year (2019) OD matrix was added to the OD matrix developed for the SPP trips expected to be in place in the design year. The design year (2046) seed OD matrix was then adjusted to fit the inbound and outbound trips in **Table 15** using a FRATAR method defined in the 2019 FDOT Project Traffic Forecasting Handbook to create a design year (2046) OD matrix.

With the design year (2046) OD matrix developed, trips along the Selmon Expressway were reviewed and the following adjustments were made as necessary to better match the horizon year TBRPM traffic patterns.

- The percent of through movements (end to end) between the design year (2046) OD matrix and the horizon year TBRPM were compared. Adjustments were made to better match the TBRPM.
- AM and PM peak hour volumes on the Selmon Expressway were reviewed after adjustments to ensure that the final AADT on the Selmon Expressway matches the forecast.

The design year (2046) OD matrix for the build scenario includes one additional adjustment. A review of the new Whiting ramp found that volumes were low while volumes on Jackson Street were high. On closer analysis, this is likely due to the missing network north of Whiting Street and west of Jefferson Street where trips may be taking Florida Avenue north to Jackson and then east back into the study area. Without that network resolution it is difficult to identify those trips, therefore some trips from the Selmon Expressway north on Florida Avenue leaving the network and trips eastbound on Jackson entering the network were shifted to the same destinations using the Selmon Expressway and new Whiting Ramp instead to provide more direct connections.

3.3.1 No-Build Network Improvements

To create the 2046 no-build network, the existing network was copied forward and modified based on network improvements documented in the Water Street Subphase 1 Transportation Analysis dated December 2018, the Water Street Phase 3 draft concept plan dated March 2020, and the THEA Comprehensive Downtown Channelside Traffic Study Technical Memorandum dated May 2018. These improvements include:

- Extend Cumberland Avenue from Meridian Avenue to Morgan Street
- Convert Channelside Drive to a two-way roadway from Morgan Street to Meridian Avenue
- Extend Water Street and Jefferson Street from Channelside Drive to Cumberland Avenue as two-way roadways
- Convert Nebraska Avenue to a two-way road between Channelside Drive and Cumberland Avenue
- Add Raybon Court to create SPP parcel connections between Water St and Meridian

In addition to these network improvements, centroid connectors at several locations were adjusted to reflect changes in the roadway network and zones 119 and 120 were split to create seven zones (for an addition of five zones) to better represent blocks created with the extension of Water Street. Zones 119 and 120 (and the subsequently split zones) will only include SPP development trips. A map of the no-build network is provided in **Figure 4** below.

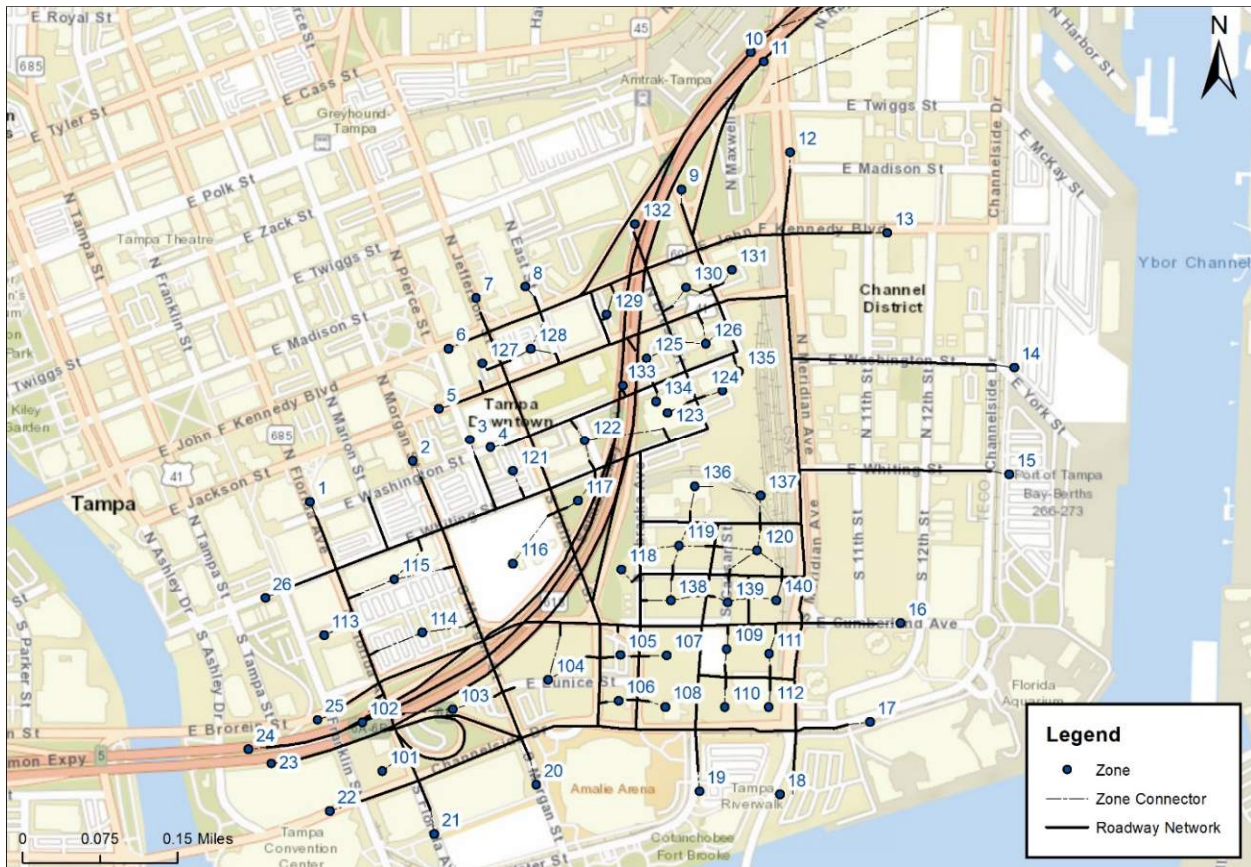

Figure 4: No-Build network and zone structure

3.3.2 No-Build Design Year (2046) Peak Hour Volumes

This design year (2046) OD matrix for the no-build scenario was then assigned to the 2046 no-build roadway network in PTV VISUM using a typical user-equilibrium assignment. The resulting assignment was checked for reasonableness between the existing year (2019) and design year (2046) by checking for growth in the OD relationships. Typically, intersection level turning movements would also be reviewed to ensure positive growth, however there are many network changes in traffic patterns and route diversion in the forecast network that make ensuring this growth not possible. As an example, the westbound right turn at Nebraska Avenue and Channelside Drive decreases substantially in the AM peak hour. A review of this change found that trips using this movement are now diverting to other routes such as the now two-way Jefferson Street, the now two-way Channelside Drive westbound, or bypassing Channelside Drive completely using the now extended Cumberland Drive. Design year (2046) AM and PM peak hour volumes are shown in **Appendix G**, respectively.

A review of observed and balanced peak hour volumes on the Selmon Expressway ramps is provided in **Table 16**. This check of peak hour volumes will be conducted during each scenario to ensure reasonable growth. Growth on the ramps is high, though this is to be expected as the volumes on the Selmon Expressway are expected to grow substantially through 2046. While the growth rate on the Selmon Expressway is moderately

high, this translates to a much higher volume on the ramps proportional to the existing volume which drives the high annual growth rate percentage.

Table 16: Existing Year (2019) and No-Build Design Year (2046) Volumes on Selmon Expressway Ramps

Location	Existing Year (2019) Balanced Volumes		Design Year (2046) Balanced Volumes		Maximum Annual Growth Rate
	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	
EB Off Ramp to Channelside Drive	249	104	1,370	563	16.7%
EB Off Ramp to Florida Avenue	741	268	969	572	4.2%
WB Off Ramp to Morgan Street & Brorein Street	918	318	1,439	747	5.0%
EB On Ramp from Brorein Street & Jefferson Street	205	699	799	1,165	10.7%
WB On Ramp from Brorein Street & Morgan Street	285	350	539	817	4.9%
WB Off Ramp to Kennedy Boulevard	1,030	991	1,814	1,418	2.8%
EB On Ramp from Nebraska Avenue	170	423	642	818	10.3%

3.3.3 No-Build Design Year (2046) AADT

Design year (2046) AADT was derived from the application of the standard peak-to-daily ratio (9.0 percent) to the maximum of the AM or PM bi-directional peak hour volumes and then rounded, as guided by the FDOT’s *Project Traffic Forecasting Handbook (2019)*. The design year (2046) AADT volumes and lane geometry for the Whiting Street PD&E Study Area are provided in **Appendix H**.

3.3.4 Build Network Improvements

To create the design year (2046) build network the no-build network was copied forward and further modified to include the following roadway improvements which form the basis of this PD&E study. Centroid connectors were adjusted to reflect changes in the roadway network. A map of the build network is provided in **Figure 5** below.

- Extend Whiting Street to Meridian Avenue
- Reconfigure the ramp to Channelside Drive to terminate at Whiting Street

Figure 5: Build network and zone structure

3.3.5 Build Design Year (2046) Peak Hour Volumes

This design year (2046) OD matrix for the build scenario was assigned to the 2046 build roadway network in PTV VISUM using a typical user-equilibrium assignment. The resulting assignment was checked for reasonableness between the existing year (2019) and design year (2046) by checking for growth in the OD relationships. Design year (2046) AM and PM peak hour volumes are shown in **Appendix I**.

A review of observed and balanced peak hour volumes on the Selmon Expressway ramps is provided in **Table 17**. This check of peak hour volumes will be conducted during each scenario to ensure reasonable growth. Like the no-build scenario, growth on the ramps is still high for the same reason. However, in the build scenario, the ramp to Channelside Drive is removed and an off-ramp to Whiting Street is added. This ramp reconfiguration is expected to allow these off-ramps to serve the middle and northern ends of the study area and shift some traffic from the ramp to Florida Avenue to the new Whiting Street ramp more directly.

Table 17: Existing Year (2019) and Build Design Year (2046) Volumes on Selmon Expressway Ramps

Location	Existing Year (2019) Balanced Volumes		Design Year (2046) Balanced Volumes		Maximum Annual Growth Rate
	AM Peak Hour	PM Peak Hour	AM Peak Hour	PM Peak Hour	
EB Off Ramp to Channelside Drive/Whiting Street	233	96	1,234	749	25.2%
EB Off Ramp to Florida Avenue	707	336	1,448	1,150	9.0%
WB Off Ramp to Morgan Street & Brorein Street	923	295	1,664	1,329	13.0%
EB On Ramp from Brorein Street & Jefferson Street	200	702	745	1,246	10.1%
WB On Ramp from Brorein Street & Morgan Street	263	335	1,137	1,465	12.5%
WB Off Ramp to Kennedy Boulevard	1,005	925	1,837	1,375	3.1%
EB On Ramp from Nebraska Avenue	158	399	706	555	12.8%

3.3.6 Build Design Year (2046) AADT

Design year (2046) AADT was derived from the application of the standard peak-to-daily ratio (9.0 percent) to the maximum of the AM or PM bi-directional peak hour volumes and then rounded, as guided by the FDOT’s *Project Traffic Forecasting Handbook (2019)*. The design year (2046) AADT volumes and lane geometry for the Whiting Street PD&E Study Area are provided in **Appendix J**.

Appendix A:
Traffic Methodology Statement

Traffic Methodology Statement

Whiting Street PD&E Study

for the Tampa Hillsborough Expressway Authority

Authority Number: HI-0141

The purpose of this Statement is to summarize the process that will be employed to collect traffic data, develop traffic forecasts, and conduct traffic operational analysis for the existing and proposed improvements for the Selmon Expressway and Whiting Street in Downtown Tampa. This project will consider the following proposed improvements, also shown in **Figure 1**:

- Segment 1 – Realignment of the Selmon Expressway eastbound off-ramp to Downtown Tampa to only access Florida Avenue;
- Segment 2 – The addition of a Selmon Expressway eastbound off-ramp to Whiting Street and realignment of the Selmon Expressway eastbound on-ramp on Jefferson Street; and
- Segment 3 – The through connection of Whiting Street from the Selmon Expressway to Meridian Avenue.

Figure 1: Proposed Improvements

A. Traffic Data Collection

- 1) 72-hour bi-directional (approach and departure volumes at 15-minute increments) machine classification counts, 6-hour (3-hours during the AM peak period and 3-hours during the PM peak period) turning movement counts, pedestrian counts, bicycle counts, and queue length observations (consists of observed lane utilization and queueing patterns) will be collected at the following intersection locations identified in **Table 1** and **Figure 2**.

Table 1: Study Intersections

Map ID	Description	Control Type
1	Whiting Street and Jefferson Street	Signalized
2	Whiting Street and Nebraska Avenue	One-Way Stop
3	Whiting Street and Brush Street	Uncontrolled
4*	Jefferson Street and the Selmon Expressway on-ramps	Uncontrolled
5*	Jefferson Street and Brorein Street	Signalized
6**	Nebraska Avenue and Brorein Street	One-Way Yield
7	Meridian Avenue/Beneficial Drive and Channelside Drive	Signalized
8*	Florida Avenue and Channelside Drive	Signalized
9*	Morgan Street and Channelside Drive	Signalized
10*	Brorein Street and Morgan Street	Signalized
11*	Selmon Expressway off-ramp to Florida Avenue	Uncontrolled
12	Florida Avenue and Whiting Street	Signalized
13	Morgan Street and Whiting Street	Signalized
14	Jefferson Street and Channelside Drive	Uncontrolled
15	Nebraska Avenue and Channelside Drive	Uncontrolled
16	Whiting Street and Meridian Drive	Signalized
17	Washington Street and Meridian Avenue	One-Way Stop
18*	Brorein Street and Florida Avenue	Signalized

*Counts for this location were previously collected in May 2019

**Only a 72-hour bi-directional count to the north

- 2) Over the same 6-hour period as the turning movement count data collection, travel time data will be collected for a minimum of two days along the following corridors identified in **Table 2** and **Figure 2**.

Table 2: Travel Time Runs

North/South Corridors	East/West Corridors
Florida Avenue	Whiting Street
Morgan Street	Brorein Street
Jefferson Street	Channelside Drive
Meridian Avenue	-

Figure 2: Existing Conditions Study Area

B. Traffic Factors

- 1) In accordance with the FDOT Project Traffic Forecasting Handbook, the standard K-factor of 9.0 percent is recommended for urbanized areas.
- 2) The calculated D-factors from the turning movement counts/tube counts will be used as seed D-factors, while utilizing TFlow Fuzzy methodology within PTV VISUM, to determine existing and future turning movement volumes for the Whiting Street study area. The low to high D-factors from the Project Forecasting Handbook will be used as the minimum and maximum values.
- 3) An average peak hour factor (PHF) based on the collected turning movement counts will be used for the existing conditions. Under future conditions, the default PHF of 0.92 will be used, as defined within the Highway Capacity Manual, 6th Edition (HCM6).
- 4) The T-factor (design hour truck percentage) will be calculated based on the weighted averages from the 72-hour class counts for the Whiting Street study area and compared to the FDOT Online traffic count stations for reasonableness.

C. Existing Year (2019) Design Traffic Volumes

- 1) An axle adjustment factor (AF) and a seasonal factor (SF) will be applied to the average of the bi-directional approach counts to obtain 2019 Annual Average Daily Traffic (AADT) Volumes.
- 2) The standard K-factor and D-factors will be applied to the 2019 AADTs to determine the directional design hour traffic volumes (DDHVs) for each of the external nodes of the study area.
- 3) The existing year (2019) design traffic volumes will be developed by utilizing the external AM and PM peak hour volumes from the 72-hour count data as inputs to the TFlow Fuzzy methodology within PTV VISUM. The existing turning movement percentages from the data collection effort will be used as targets for each study intersection.
- 4) Traffic volumes will be balanced where traffic volume breaks cannot be validated based on roadway features, such as side streets or driveways. This will result in sinks/sources being added to the VISSIM network, wherever a volume break is validated.

D. Existing Year (2019) Operational Analysis

- 1) Microsimulation will be performed using PTV VISSIM 11 for each of the study intersections defined in **Section A**. HCM methodologies will be used to estimate the level of service for each study intersection based on the intersection delay resulting from the VISSIM analysis.
- 2) AM and PM peak period traffic simulation models will be ran for a minimum of three hours, not including the network loading time, as is defined in the FDOT Traffic Analysis Handbook. The network loading time, the time it takes to traverse the longest path through the network twice, will be rounded up to the nearest 15 minute interval. The three hour analysis period will be broken up into one-hour intervals, consisting of one hour for startup, one hour for the peak, and one hour for dissipation of the peak.
- 3) Volumes for the network loading time, startup time, and dissipation of the peak will be determined as a proportion of the peak hour volumes, relative to the traffic data collection efforts.
- 4) The number of simulation runs needed for the VISSIM analysis will be determined based on methodologies outlined in Section 7.4.4 of the Traffic Analysis Handbook, with a minimum of 10 runs and a maximum of 30 runs. The simulation runs will be generated with different random number seeds. Results will be averaged for reporting purposes, as is defined in the Traffic Analysis Handbook.
- 5) Calibration efforts of the VISSIM network will be conducted as is outlined in the Traffic Analysis Handbook.
- 6) Upon calibration of the network, existing year (2019) operational analysis will consist of intersection delay and level of service (LOS), queue analysis, and travel time analysis.

E. Corridor Design Considerations and Configurations

- 1) The No-Build Alternative will assume that Whiting Street, the cross streets, and the surrounding area remain unchanged, except for any programmed improvements in association with the planned redevelopments in the area.
- 2) The Build Alternative will consist of the proposed improvements to the access of the Selmon Expressway and Whiting Street as previously defined in the introduction, as well as improvements to the ramp terminal, Whiting Street, and the study area intersections as needed. The Build Alternative will also consider the additional intersections identified in **Table 3** and **Figure 3**.

Table 3: Additional Intersections for the Build Alternative

Map ID	Description	Existing Intersection?	Future Control Type
19	Water Street and Channelside Drive	Yes	Signalized
20	Cumberland Avenue and Water Street	No	Signalized
21	Cumberland Avenue and Meridian Avenue	Yes	Signalized

Figure 3: Build Alternative Study Area

F. Traffic Forecasts

- 1) The Authority will provide a calibrated version of the THEA approved Tampa Bay Regional Model (TBRPM), with the base year 2015, interim year 2030, and forecast year 2040.
- 2) The 2015 validation model will be checked for reasonableness and, if necessary, additional adjustments will be made to improve accuracy. Additionally, the 2030 interim and 2040 forecast models will be checked for reasonable growth in the study area. The guidelines of the FDOT Project Traffic Forecasting Handbook will be used as the criteria for evaluating model validity.
- 3) Different opening year (2026), interim year (2036), and design year (2046) AADTs will be determined for the No-Build and Build Alternative. Because the model's horizon year is 2040, the model volumes will be extrapolated from 2040 to 2046 to determine design year (2046) AADTs. The existing year (2019) and design year (2046) AADTs will be interpolated to arrive at opening year (2026) and interim year (2036) AADTs.
- 4) Opening year (2026), interim year (2036), and design year (2046) AM and PM peak hour volumes will be developed by applying the forecasted growth rates from 2019 to each of the external nodes of the network, which will be assigned to the VISUM network to develop link and turning movement volumes. The same external AADTs will be used for both the No-Build and Build Alternatives. However, AADTs and volumes within the network are expected to shift due to the additional route choice provided by the Build Alternative.

G. Future Traffic Analysis

- 1) Microsimulation for the No-Build and Build Alternatives will be conducted for the opening year (2026), interim year (2036), and design year (2046). PTV VISSIM 11 and HCM methodologies, outlined in **Section D**, will be utilized to conduct such analyses during the AM and PM periods.
- 2) The LOS target shall be D at each study intersection, consistent with the FDOT's Quality/Level of Service Handbook, 2013.
- 3) Geometric and signal timing improvements will be recommended, as appropriate, to optimize traffic operations of the network in trying to achieve the LOS D threshold. Synchro will be utilized for such analyses and imported into the VISSIM network.

H. Air and Noise

- 1) The FDOT's Traffic Data for Air Study Screening Test and Traffic Data for Noise Studies spreadsheets will be filled out and provided.

I. Documentation

- 1) A *Traffic Forecasting Technical Memorandum* will be prepared documenting the volume development and forecasting efforts of the existing year (2019), opening year (2026), interim year (2036), and design year (2046) design traffic volumes, outlined in **Sections C and F**.
- 2) A *Calibration Technical Memorandum* will be prepared documenting the calibration efforts of the existing year (2019) VISSIM network, outlined in **Section D**.
- 3) A *Project Traffic Analysis Report* will be prepared documenting the results of all analyses and procedures outlined in this *Methodology Statement*.

Appendix C:
Statistical Evaluation of Existing Volume Development

Statistical Evaluation of Existing Volume Development

Existing Year Design Traffic, as processed through PTV VISUM and TFLOW Fuzzy, was validated against the originally collected traffic counts using the following methods. Divergence from these criteria will be discussed.

Link Counts

- At all links at the periphery of the study area, ramps to or from the Selmon Expressway, and the Selmon Expressway itself a detailed comparison between 72-hour or 48-hour counts, turning movement counts, and the balanced link volumes was conducted to ensure that for all of these locations the balanced volume is always greater than the 72-hour or 48-hour count data for both the AM and PM peak period. This check will ensure that no volumes are lost during the balancing process.
- AADT will be re-calculated from the maximum of the AM and PM peak hourly volumes at each count location using a standard K factor. This modeled AADT will be compared to the counted AADT value. To measure these differences, percent root mean square error (RMSE) values defined in the FDOT *“Project Traffic Forecasting Handbook”* will be used to define what tolerance is acceptable or preferred. Access and egress for I-75 is a key component of this study. As such, special care will be taken in validating ramp volumes.

Turning Movement Counts

- Turning movement counts (TMCs) are within 10% and 35 volume of the count data.
- A systemwide check that the difference between all TMCs and VISUM processed turning movement volumes is less than 5 percent to meet the VISSIM calibration criteria provided in Table 7-7 of the *“FDOT Traffic Analysis Handbook.”*
- Relative flows at the TMCs will also be checked to confirm there are no significant changes that might point to changes in distribution patterns. This check will use RMSE to compare the observed and balanced volume relative flows.

Link Counts

There are 70 observed directional counts on links in the study area network which were collected as either 48-hour or 72-hour machine counts. These counts were collected on both surface streets and ramps to and from the Selmon Expressway.

The first check of balanced link volumes compared to counted link volumes was verifying that the counts collected from the 48-hour and 72-hour counts (denoted as machine counts in the tables) was always equal to or higher than the balanced volumes at all links on the periphery of the study area, all ramps to or from the Selmon Expressway, and the Selmon Expressway itself during the defined AM and PM peak hours. **Table 1** provides this comparison for the Selmon Expressway Ramps, **Table 2** provides this comparison for all northbound or eastbound links, and

Table 3 provides this comparison for all southbound or westbound links. Each one of these tables provides the machine counted value, the turning movement count for the approach, the balanced volume on the link, and percent differences between the balanced and machine counts and the turning movement count and the machine count. The focus of this analysis is the “Balanced to Machine Count” column to ensure this is never negative. Comparisons between the link machine counts and the turning movement counts are provided for information purposes only to note that there was sometimes significant imbalances between machine counts and turning movement counts, despite no source of sink or source between them. There is no balanced link volume which is less than the machine counted volume and large discrepancies from the machine count are accounted for by a much higher TMC.

Table 1: Comparison of link volumes on ramps

Location	AM Peak Hour			PM Peak Hour

The second check of processed volumes compared to counted volumes is a RMSE comparison of the counted daily volume to the back-calculated AADT volume from the processed counts. To back calculate AADT from the processed counts the maximum (AM or PM peak hour) of the bi-directional volume on a link was divided by the standard K-factor 0.09. **Table 4** provides this analysis by volume range. The volume ranges and acceptable tolerances were taken directly from the FDOT’s standard validation procedures for a travel demand model for comparing observed and modeled count data. While this is not explicitly what the measure was defined to be used for, it does provide a good foundation for how closely observed volumes match balanced volumes. **Figure 1** is a plot of processed directional AADT compared to directional count volumes for the same 70 count locations in the study area. The blue line illustrates $y=x$ where the processed count would equal the observed count.

Table 4: RMSE Comparison of Counted Directional Daily Volume and Balanced Directional AADT

Group	Volume Range	Number of Observations	RMSE	FSUTMS Standards	
				Acceptable	Preferable
1	<= 5K VPD	37	38%	100%	45%
2	5K - 10K VPD	14	8%	45%	35%
3	10K - 15K VPD	4	26%	35%	27%
4	15K - 20K VPD	7	15%	30%	25%
5	20K - 30K VPD	6	7%	27%	15%
6	30K - 50K VPD	0	NA	25%	15%
7	50k - 60K VPD	0	NA	20%	10%
8	60k + VPD	0	NA	19%	10%
Total	Area-wide	68	19%	45%	35%

Table 4 indicates that for all volume groups the RMSE is within the preferable tolerances. **Figure 2** indicates somewhat more deviation from the count data at the larger volumes.

Figure 1: Observed versus Balanced Directional AADT

Turning Movement Counts

This validation is based on the collected turning movement counts throughout the study area. There are 185 turning movements counted in the AM Peak Hour and 185 turning movements counted in the PM Peak Hour in the study area. **Figure 2** illustrates variance from the blue $y=x$ line bisecting the graphs. This figure shows that the observed counts and processed volumes match reasonably well throughout with no major outliers.

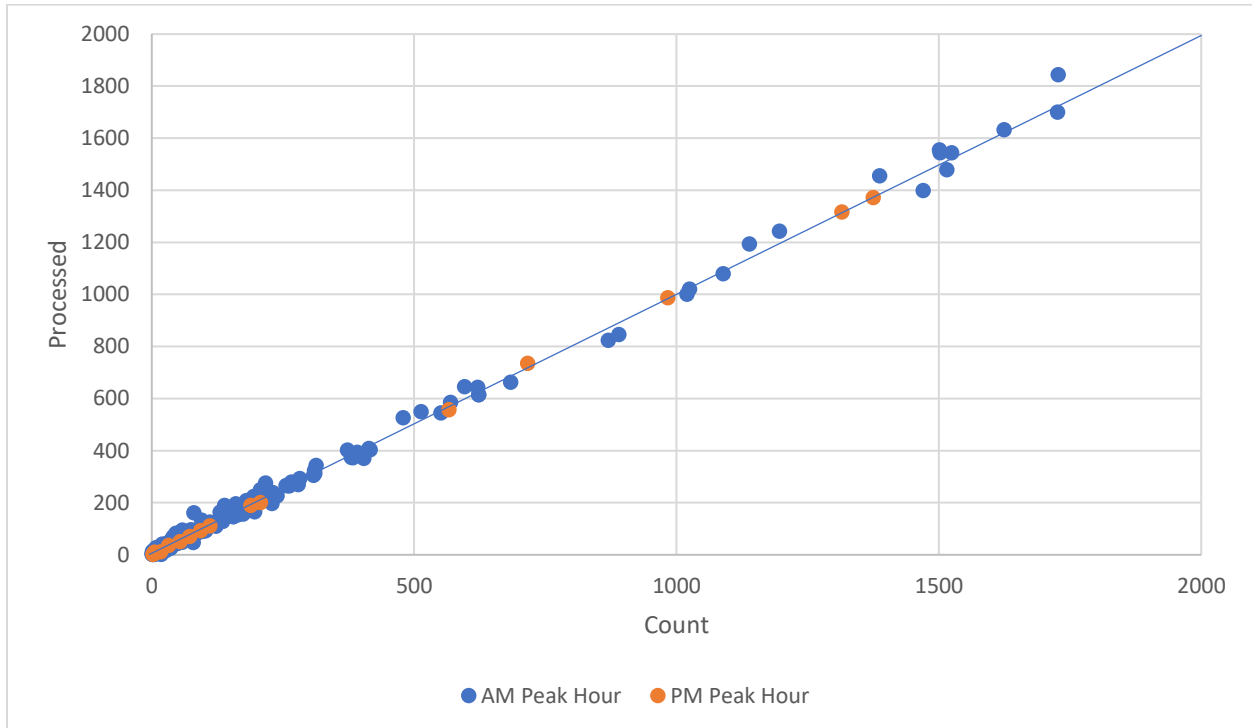

Figure 2: Observed vs. Balanced Turning Movement Volumes during the AM and PM Peak Hours

During the AM peak hour, nine turning movements fell outside of the defined criteria for convergence. In all nine of these cases, the balanced volume is higher than the counted volume. All nine of these nine turning movements fell out of the convergence criteria during a review and adjustments of link volumes compared to machine count volumes as documented in the previous section.

During the PM peak hour, one turning movement fell outside of the defined criteria for convergence. In this case, the balanced volume is higher than the counted volume. This turning movement fell out of the convergence criteria during a review and adjustments of link volumes compared to machine count volumes as documented in the previous section.

The volumes produced through this process will be used for a micro-simulation effort using PTV VISSIM software. FDOT's Project Traffic Forecasting Handbook (Table 7-7) sets a calibration criterion for microsimulation of no more than 5 percent system-wide deviation between simulation and observed volumes. To that end, observed and estimated volumes in the PTV VISUM model should also not deviate by more than 5 percent system wide. **Table 5** indicates that system-wide volume to capacity ratio for both the AM and PM peak hour meets this criterion.

Table 5: System-Volume to Capacity Ratio

Peak Hour	Total Volume	Total Counts	Percent Variance
AM (7:30 to 8:30)	42,897	43,934	2.4%
PM (4:30 to 5:30)	39,711	40,444	1.8%

The final check of processed volumes compared to turning movement counts is a comparison of relative flows at the approaches for all intersections to confirm there are no significant changes that might point to changes in distribution patterns. That is, at each approach, the percent left, through, right, and u turns will be compared against the counted value. **Table 6** below provides a comparison using Root Mean Square Error (RMSE) which is an established measure of estimated values compared to observed values.

Table 6: Root Mean Square Error of Relative Flows for all Turning Movements

Group	Volume Range	Number of Observations	RMSE
AM Peak Hour			
1	<=20 VPH	42	1.31%
2	20 to 100 VPH	54	0.15%
3	100 to 250 VPH	47	0.02%
4	250 to 500 VPH	18	0.01%
5	500 to 1,000 VPH	10	0.00%
6	> 1,000 VPH	14	0.00%
Total	Area-wide	185	0.03%
PM Peak Hour			
1	<=20 VPH	40	1.09%
2	20 to 100 VPH	73	0.18%
3	100 to 250 VPH	27	0.01%
4	250 to 500 VPH	19	0.01%
5	500 to 1,000 VPH	16	0.00%
6	> 1,000 VPH	10	0.00%
Total	Area-wide	185	0.04%

This RMSE analysis indicates that during the AM peak hour even for small movements of less than 20 vehicles a comparison of relative flows between the count and processed data is near or within 1 percent. Overall, this different is just 3/100 of a percent. During the PM peak hour even for small movements of less than 20 vehicles a comparison of relative flows between the count and processed data is near or within 1 percent. Overall, this different is just 4/100 of a percent. This analysis indicates that there is very little variation in relative flow between the observed and processed data which indicates that the method for processing the data did not make any changes to traffic distribution across 185 movements in the study area.
