Document Title	Specification of Key Manager
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	907

Document Status	published
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	R22-11

Document Change History

Date	Release	Changed by	Description
2022-11-24	R22-11	AUTOSAR Release Management	• Add the certificate handling to keyM. • Add new configuration parameter to KeyMCertificate container. • Add new format for representing certificate. • Editorial changes.
2021-11-25	R21-11	AUTOSAR Release Management	• Editorial changes. • Add upstream requirements.
2020-11-30	R20-11	AUTOSAR Release Management	• Editorial changes, improve error section. • Add security events for IdsM. • Detail order of certificate verification. • Align functions, parameters and return values for C-API and service interfaces. • Signing request reference for CSR.
2019-11-28	R19-11	AUTOSAR Release Management	• Editorial changes. • Create general error detection in chapter 7.4. • Changed Document Status from Final to published
2018-10-31	4.4.0	AUTOSAR Release Management	• Initial release

Disclaimer

Contents

Known Limitations

None.

1 Introduction and functional overview

This specification describes the functionality, API and the configuration for the AUTOSAR Basic Software module <KeyManager>.

The AUTOSAR KeyM module consists of two sub modules, the crypto key submodule and the certificate submodule as required by [1] "AUTOSAR Requirements on Crypto Stack".

The crypto key submodule provides an API and configuration items to introduce or update pre-defined cryptographic key material. It acts as a key client to interpret the provided data from a key server and to create respective key materials. These keys are provided to the crypto service manager. After successful installation of the key material, the application is able to utilize the crypto operations. This allows OEMs to introduce key materials in production or maintenance phase to ECUs separate from the application.

The certificate submodule provides an API and configuration to operate on certificates. It allows to define certificate slots and associate them in a hierarchy as it is used in a PKI. Certificates can be permanently stored like a Root or intermediate certificate(s) so that they can be used to verify a given certificate against a certificate chain. Furthermore, the certificate submodule allows to access certificate elements or to verify its contents.

1.1 Important note

This specification provides skeletons of an API for a Vehicle Key and Certificate Management system. Not all functionalities have been completely specified. This may allow some freedom of interpretation and implementation details. Even though the interfaces have been designed in a generic and flexible way it might be the case that they can change in upcoming AUTOSAR releases.

2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the <MODULE_NAME> module that are not included in the [2, AUTOSAR glossary].

Abbreviation / Acronym:	Description:
KeyM	Key Manager
PKI	Public Key Infrastructure
CSR	Certificate Signing Request
CSM	Crypto Service Manager
CRL	Certificate Revocation List
CA	Certificate Authority
OID	Object Identifier. A byte array that identifies a certificate element or group or list of certificate elements.

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [4, SWS BSW General], which is also valid for the Key Management module.

Thus, the specification SWS BSW General shall be considered as additional and required specification for the Key and Certificate Management module.

4 Constraints and assumptions

4.1 Limitations

The Key Management module shall be used with a Crypto Service Manager and its underlying modules.

Only a single KeyElement (with ID = 1) per CsmKey is currently supported.

4.2 Applicability to car domains

This specification has no limitations to specific car domains.

5 Dependencies to other modules

This chapter lists the relations to other modules that are used by the AUTOSAR KeyM module.

5.1 Dependencies to Crypto Service Manager

The KeyM module depends on cryptographic algorithms and functions provided by the [5] "Csm module". The KeyM module requires API functions to retrieve and set key elements and to verify signatures of certificates, namely:

- Key Setting Interface
- Key Extraction Interface
- Key Copying Interface
- Key Generation Interface
- Key Derivation Interface
- Key Exchange Interface
- Signature Interface

5.2 Dependencies to Non Volatile Memory

The KeyM can be configured to store key material in non volatile memory. This requires interfaces to NVM.

5.3 Dependencies to Synchronized Time Base

The time for certificate validation period is provided by the STBM.

6 Requirements Tracing

The following tables reference the requirements specified in <CITATIONS_OF_CONTRIBUTED_DOCUMENTS> and links to the fulfillment of these. Please note that if column “Satisfied by” is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by
[RS_Ids_00810]	Basic SW security events	[SWS_KeyM_00171] [SWS_KeyM_00172] [SWS_KeyM_00173]
[SRS_BSW_00005]	Modules of the μC Abstraction Layer (MCAL) may not have hard coded horizontal interfaces	[SWS_KeyM_00174]
[SRS_BSW_00101]	The Basic Software Module shall be able to initialize variables and hardware in a separate initialization function	[SWS_KeyM_00043]
[SRS_BSW_00161]	The AUTOSAR Basic Software shall provide a microcontroller abstraction layer which provides a standardized interface to higher software layers	[SWS_KeyM_00174]
[SRS_BSW_00162]	The AUTOSAR Basic Software shall provide a hardware abstraction layer	[SWS_KeyM_00174]
[SRS_BSW_00168]	SW components shall be tested by a function defined in a common API in the Basis-SW	[SWS_KeyM_00174]
[SRS_BSW_00170]	The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands	[SWS_KeyM_00036]
[SRS_BSW_00172]	The scheduling strategy that is built inside the Basic Software Modules shall be compatible with the strategy used in the system	[SWS_KeyM_00074] [SWS_KeyM_00075]
[SRS_BSW_00310]	API naming convention	[SWS_KeyM_00043] [SWS_KeyM_00047] [SWS_KeyM_00049] [SWS_KeyM_00050] [SWS_KeyM_00052] [SWS_KeyM_00053] [SWS_KeyM_00054] [SWS_KeyM_00057] [SWS_KeyM_00058] [SWS_KeyM_00059] [SWS_KeyM_00060] [SWS_KeyM_00061] [SWS_KeyM_00063] [SWS_KeyM_00064] [SWS_KeyM_00065] [SWS_KeyM_00066] [SWS_KeyM_00067] [SWS_KeyM_00068] [SWS_KeyM_00069] [SWS_KeyM_00070] [SWS_KeyM_00071] [SWS_KeyM_00072] [SWS_KeyM_00073] [SWS_KeyM_00074] [SWS_KeyM_00075] [SWS_KeyM_00077] [SWS_KeyM_00079] [SWS_KeyM_00081] [SWS_KeyM_00147] [SWS_KeyM_91014] [SWS_KeyM_91015]
[SRS_BSW_00312]	Shared code shall be reentrant	[SWS_KeyM_00064] [SWS_KeyM_00065] [SWS_KeyM_00073] [SWS_KeyM_00077] [SWS_KeyM_00079] [SWS_KeyM_00081] [SWS_KeyM_00147]
[SRS_BSW_00331]	All Basic Software Modules shall strictly separate error and status information	[SWS_KeyM_00036]
[SRS_BSW_00336]	Basic SW module shall be able to shutdown	[SWS_KeyM_00174]

△

Requirement	Description	Satisfied by
[SRS_BSW_00345]	BSW Modules shall support pre-compile configuration	[SWS_KeyM_00157]
[SRS_BSW_00350]	All AUTOSAR Basic Software Modules shall allow the enabling/ disabling of detection and reporting of development errors.	[SWS_KeyM_00144]
[SRS_BSW_00351]	Encapsulation of compiler specific methods to map objects	[SWS_KeyM_00174]
[SRS_BSW_00357]	For success/failure of an API call a standard return type shall be defined	[SWS_KeyM_00050] [SWS_KeyM_00051] [SWS_KeyM_00052] [SWS_KeyM_00053] [SWS_KeyM_00054] [SWS_KeyM_00056] [SWS_KeyM_00057] [SWS_KeyM_00058] [SWS_KeyM_00059] [SWS_KeyM_00060] [SWS_KeyM_00061] [SWS_KeyM_00063] [SWS_KeyM_00064] [SWS_KeyM_00065] [SWS_KeyM_00066] [SWS_KeyM_00067] [SWS_KeyM_00068] [SWS_KeyM_00069] [SWS_KeyM_00070] [SWS_KeyM_00071] [SWS_KeyM_91014] [SWS_KeyM_91015]
[SRS_BSW_00358]	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	[SWS_KeyM_00043]
[SRS_BSW_00369]	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	[SWS_KeyM_00036] [SWS_KeyM_00078]
[SRS_BSW_00375]	Basic Software Modules shall report wake-up reasons	[SWS_KeyM_00174]
[SRS_BSW_00377]	A Basic Software Module can return a module specific types	[SWS_KeyM_00040]
[SRS_BSW_00383]	The Basic Software Module specifications shall specify which other configuration files from other modules they use at least in the description	[SWS_KeyM_00037]
[SRS_BSW_00384]	The Basic Software Module specifications shall specify at least in the description which other modules they require	[SWS_KeyM_00037]
[SRS_BSW_00385]	List possible error notifications	[SWS_KeyM_00036]
[SRS_BSW_00386]	The BSW shall specify the configuration and conditions for detecting an error	[SWS_KeyM_00036] [SWS_KeyM_00078]
[SRS_BSW_00404]	BSW Modules shall support post-build configuration	[SWS_KeyM_00157]
[SRS_BSW_00406]	A static status variable denoting if a BSW module is initialized shall be initialized with value 0 before any APIs of the BSW module is called	[SWS_KeyM_00174]
[SRS_BSW_00407]	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	[SWS_KeyM_00049]
[SRS_BSW_00413]	An index-based accessing of the instances of BSW modules shall be done	[SWS_KeyM_00174]

▽

△

Requirement	Description	Satisfied by
[SRS_BSW_00414]	Init functions shall have a pointer to a configuration structure as single parameter	[SWS_KeyM_00043] [SWS_KeyM_00158]
[SRS_BSW_00416]	The sequence of modules to be initialized shall be configurable	[SWS_KeyM_00174]
[SRS_BSW_00417]	Software which is not part of the SW-C shall report error events only after the Dem is fully operational.	[SWS_KeyM_00174]
[SRS_BSW_00419]	If a pre-compile time configuration parameter is implemented as `const` it should be placed into a separate c-file	[SWS_KeyM_00174]
[SRS_BSW_00422]	Pre-de-bouncing of error status information is done within the Dem	[SWS_KeyM_00174]
[SRS_BSW_00425]	The BSW module description template shall provide means to model the defined trigger conditions of schedulable objects	[SWS_KeyM_00174]
[SRS_BSW_00432]	Modules should have separate main processing functions for read/receive and write/transmit data path	[SWS_KeyM_00174]
[SRS_BSW_00448]	Module SWS shall not contain requirements from other modules	[SWS_KeyM_00174]
[SRS_BSW_00449]	BSW Service APIs used by Autosar Application Software shall return a Std_ReturnType	[SWS_KeyM_00174]
[SRS_BSW_00452]	Classification of runtime errors	[SWS_KeyM_00174]
[SRS_BSW_00453]	BSW Modules shall be harmonized	[SWS_KeyM_00174]
[SRS_BSW_00454]	An alternative interface without a parameter of category DATA_ REFERENCE shall be available.	[SWS_KeyM_00174]
[SRS_BSW_00456]	A Header file shall be defined in order to harmonize BSW Modules	[SWS_KeyM_00174]
[SRS_BSW_00457]	Callback functions of Application software components shall be invoked by the Basis SW	[SWS_KeyM_00159]
[SRS_BSW_00458]	Classification of production errors	[SWS_KeyM_00174]
[SRS_BSW_00459]	It shall be possible to concurrently execute a service offered by a BSW module in different partitions	[SWS_KeyM_00174]
[SRS_BSW_00461]	Modules called by generic modules shall satisfy all interfaces requested by the generic module	[SWS_KeyM_00174]
[SRS_BSW_00462]	All Standardized Autosar Interfaces shall have unique requirement Id / number	[SWS_KeyM_00174]
[SRS_BSW_00466]	Classification of extended production errors	[SWS_KeyM_00174]
[SRS_BSW_00469]	Fault detection and healing of production errors and extended production errors	[SWS_KeyM_00174]
[SRS_BSW_00470]	Execution frequency of production error detection	[SWS_KeyM_00174]

▽

△

Requirement	Description	Satisfied by
[SRS_BSW_00471]	Do not cause dead-locks on detection of production errors - the ability to heal from previously detected production errors	[SWS_KeyM_00174]
[SRS_BSW_00472]	Avoid detection of two production errors with the same root cause.	[SWS_KeyM_00174]
[SRS_BSW_00473]	Classification of transient faults	[SWS_KeyM_00174]
[SRS_BSW_00478]	Timing limits of main functions	[SWS_KeyM_00074]
[SRS_BSW_00479]	Interfaces for handling request from external devices	[SWS_KeyM_00174]
[SRS_BSW_00480]	Null pointer errors shall follow a naming rule	[SWS_KeyM_00146]
[SRS_BSW_00481]	Invalid configuration set selection errors shall follow a naming rule	[SWS_KeyM_00174]
[SRS_BSW_00482]	Get version information function shall follow a naming rule	[SWS_KeyM_00049]
[SRS_BSW_00483]	BSW Modules shall handle buffer alignments internally	[SWS_KeyM_00174]
[SRS_BSW_00484]	Input parameters of scalar and enum types shall be passed as a value.	[SWS_KeyM_00050] [SWS_KeyM_00051] [SWS_KeyM_00052] [SWS_KeyM_00053] [SWS_KeyM_00054] [SWS_KeyM_00056] [SWS_KeyM_00057] [SWS_KeyM_00058] [SWS_KeyM_00059] [SWS_KeyM_00060] [SWS_KeyM_00061] [SWS_KeyM_00063] [SWS_KeyM_00064] [SWS_KeyM_00066] [SWS_KeyM_91014] [SWS_KeyM_91015]
[SRS_BSW_00485]	Input parameters of structure type shall be passed as a reference to a constant structure	[SWS_KeyM_00043] [SWS_KeyM_00057] [SWS_KeyM_00061]
[SRS_BSW_00486]	Input parameters of array type shall be passed as a reference to the constant array base type	[SWS_KeyM_00050] [SWS_KeyM_00051] [SWS_KeyM_00052] [SWS_KeyM_00053] [SWS_KeyM_00054] [SWS_KeyM_00056]
[SRS_BSW_00487]	Errors for module initialization shall follow a naming rule	[SWS_KeyM_00144]
[SRS_BSW_00494]	ServiceInterface argument with a pointer datatype	[SWS_KeyM_00041] [SWS_KeyM_91000] [SWS_KeyM_91004] [SWS_KeyM_91012]
[SRS_CryptoStack_-00003]	The crypto stack shall be able to incorporate modules of the crypto library	[SWS_KeyM_00174]
[SRS_CryptoStack_-00006]	Each primitive of the CRYIF shall belong to exactly one service of the CSM	[SWS_KeyM_00174]
[SRS_CryptoStack_-00007]	The Crypto Stack shall provide scalability for the cryptographic features	[SWS_KeyM_00001] [SWS_KeyM_00002]
[SRS_CryptoStack_-00008]	The Crypto Stack shall allow static configuration of keys used for cryptographic jobs	[SWS_KeyM_00174]
[SRS_CryptoStack_-00009]	The Crypto Stack shall support reentrancy for all crypto services	[SWS_KeyM_00174]
[SRS_CryptoStack_-00010]	The Crypto Stack shall conceal symmetric keys from the users of crypto services	[SWS_KeyM_00051] [SWS_KeyM_00091]

▽

△

Requirement	Description	Satisfied by
[SRS_CryptoStack_-00011]	The Crypto Stack shall conceal asymmetric private keys from the users of Crypto services	[SWS_KeyM_00302]
[SRS_CryptoStack_-00013]	The modules of the crypto stack shall support only pre-compile time configuration	[SWS_KeyM_00001] [SWS_KeyM_00002] [SWS_KeyM_00007] [SWS_KeyM_00010]
[SRS_CryptoStack_-00014]	The Crypto Interface shall have an interface to the static configuration information of the Crypto Driver	[SWS_KeyM_00174]
[SRS_CryptoStack_-00015]	Channels mapped to different Crypto Driver Objects shall be uniquely configurable in Crypto Interface	[SWS_KeyM_00174]
[SRS_CryptoStack_-00019]	The Crypto Stack shall identify random number generation as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00174]
[SRS_CryptoStack_-00020]	The Crypto Stack shall identify symmetric encryption/decryption as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00174]
[SRS_CryptoStack_-00021]	The Crypto Stack shall identify asymmetric encryption/decryption as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00174]
[SRS_CryptoStack_-00022]	The Crypto Stack shall identify MAC generation/verification as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00108]
[SRS_CryptoStack_-00023]	The Crypto Stack shall identify asymmetric signature generation/ verification as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00113] [SWS_KeyM_00136]
[SRS_CryptoStack_-00024]	The Crypto Stack shall identify hash calculation as a cryptographic primitive which can be requested to a driver	[SWS_KeyM_00174]
[SRS_CryptoStack_-00026]	The Crypto Stack shall provide an interface for the generation of asymmetric keys	[SWS_KeyM_00174]
[SRS_CryptoStack_-00027]	The Crypto Stack shall provide an interface for the generation of symmetric keys	[SWS_KeyM_00089] [SWS_KeyM_00091] [SWS_KeyM_00100]
[SRS_CryptoStack_-00028]	The Crypto Stack shall provide an interface for key exchange mechanisms	[SWS_KeyM_00003] [SWS_KeyM_00004] [SWS_KeyM_00005] [SWS_KeyM_00085] [SWS_KeyM_00086]
[SRS_CryptoStack_-00029]	The Crypto Stack shall provide an interface for key wrapping/extraction mechanisms	[SWS_KeyM_00051] [SWS_KeyM_00052]
[SRS_CryptoStack_-00031]	The Crypto Stack shall provide an interface for parsing certificates	[SWS_KeyM_00045] [SWS_KeyM_00060] [SWS_KeyM_00134] [SWS_KeyM_00135] [SWS_KeyM_00139]
[SRS_CryptoStack_-00034]	The Crypto Interface shall report detected development errors to the Default Error Tracer	[SWS_KeyM_00174]

▽

△

Requirement	Description	Satisfied by
[SRS_CryptoStack_-00036]	The Crypto Driver shall allow static configuration of Crypto Driver Objects	[SWS_KeyM_00174]
[SRS_CryptoStack_-00061]	The Crypto Stack shall support detection of invalid keys	[SWS_KeyM_00113]
[SRS_CryptoStack_-00075]	The Crypto Interface shall be the interface layer between the underlying crypto driver(s) and upper layers	[SWS_KeyM_00174]
[SRS_CryptoStack_-00076]	The Crypto Interface implementation and interface shall be independent from underlying Crypto Hardware or Software	[SWS_KeyM_00174]
[SRS_CryptoStack_-00079]	The job processing mode (synchronous or asynchronous) of a CSM service shall be defined by static configuration	[SWS_KeyM_00174]
[SRS_CryptoStack_-00080]	The set of cryptographic services provided by the CSM shall be defined by static configuration	[SWS_KeyM_00021]
[SRS_CryptoStack_-00081]	The CSM module specification shall specify which other modules are required	[SWS_KeyM_00174]
[SRS_CryptoStack_-00082]	The CSM module specification shall specify the interface and behavior of the callback function, if the asynchronous job processing mode is selected	[SWS_KeyM_00174]
[SRS_CryptoStack_-00084]	The CSM module shall use the streaming approach for some selected services	[SWS_KeyM_00174]
[SRS_CryptoStack_-00086]	The CSM module shall distinguish between error types	[SWS_KeyM_00036] [SWS_KeyM_00155]
[SRS_CryptoStack_-00087]	The CSM module shall report detected development errors to the Default Error Tracer	[SWS_KeyM_00037] [SWS_KeyM_00044] [SWS_KeyM_00078] [SWS_KeyM_00144] [SWS_KeyM_00145] [SWS_KeyM_00146]
[SRS_CryptoStack_-00088]	The CSM module shall provide an abstraction layer which offers a standardized interface to higher software layers to access cryptographic algorithms	[SWS_KeyM_00174]
[SRS_CryptoStack_-00089]	The CSM module shall be located in the AUTOSAR service layer	[SWS_KeyM_00174]
[SRS_CryptoStack_-00090]	The CSM shall provide an interface to be accessible via the RTE	[SWS_KeyM_00160] [SWS_KeyM_00161] [SWS_KeyM_00162] [SWS_KeyM_00163] [SWS_KeyM_00164] [SWS_KeyM_91009] [SWS_KeyM_91019] [SWS_KeyM_91020]
[SRS_CryptoStack_-00091]	The CSM shall provide one Provide–Port for each configuration	[SWS_KeyM_00160] [SWS_KeyM_00161] [SWS_KeyM_00162] [SWS_KeyM_00163] [SWS_KeyM_00164] [SWS_KeyM_91009] [SWS_KeyM_91019] [SWS_KeyM_91020]
[SRS_CryptoStack_-00094]	The configuration files of the crypto stack modules shall be readable for human beings	[SWS_KeyM_91003]
[SRS_CryptoStack_-00095]	The Crypto Driver module shall strictly separate error and status information	[SWS_KeyM_00174]

▽

△

Requirement	Description	Satisfied by
[SRS_CryptoStack_-00096]	The CSM module shall not return specific development error codes via the API	[SWS_KeyM_00009] [SWS_KeyM_00040] [SWS_KeyM_00082] [SWS_KeyM_00083] [SWS_KeyM_00084] [SWS_KeyM_00085] [SWS_KeyM_00086] [SWS_KeyM_00090] [SWS_KeyM_00099] [SWS_KeyM_00104] [SWS_KeyM_00116] [SWS_KeyM_00117] [SWS_KeyM_00119] [SWS_KeyM_00121] [SWS_KeyM_00125] [SWS_KeyM_00128] [SWS_KeyM_00132] [SWS_KeyM_00141] [SWS_KeyM_00155] [SWS_KeyM_00166]
[SRS_CryptoStack_-00097]	The CSM shall check passed API parameters for validity	[SWS_KeyM_00174]
[SRS_CryptoStack_-00098]	The Crypto Driver shall provide access to all cryptographic algorithms supported by the hardware	[SWS_KeyM_00174]

Table 6.1: RequirementsTracing

7 Functional specification

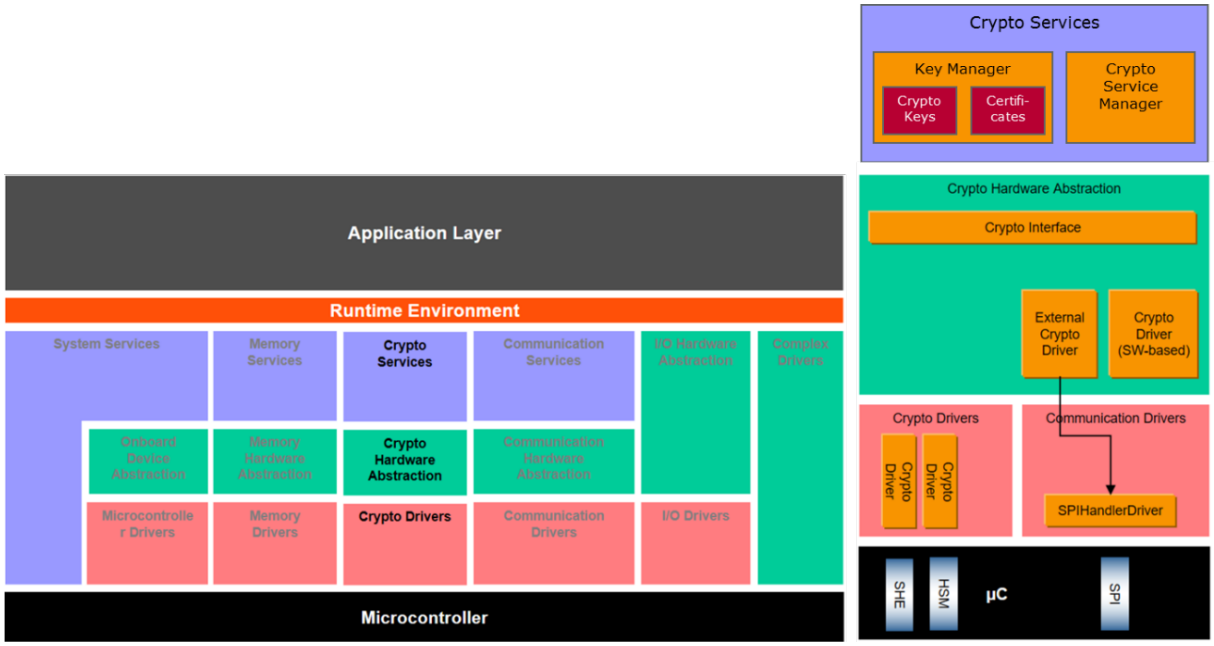

Figure 7.1: AUTOSAR layered view with KEYM.

The Key Management module can roughly be divided into two parts: the crypto key sub module and the certificate sub module. The crypto key sub module is mainly used to interact with a key provisioning entity (key master) that initiates the generation or provides key material directly. These keys are assigned to crypto keys of the CSM and stored in dedicated NVM blocks or can be stored as keys of the respective crypto driver. The certificate sub module allows to configure certificates of a chain, providing interfaces to store and verify them. The public key contained in a certificate can further be assigned to CSM keys so that they can be used by crypto jobs.

[SWS_KeyM_00001] ⌈The crypto key sub module of the Key Manager shall be completely disabled if KeyMCryptoKeyManagerEnabled is set to FALSE. No function shall be available, and no resources shall be allocated in this case that is not needed for other operation.⌋*(SRS_CryptoStack_00013, SRS_CryptoStack_00007)*

[SWS_KeyM_00002] ⌈The support of the certificate sub module within the Key Manager shall be completely disabled if KeyMCertificateManagerEnabled is set to FALSE. No function shall be available and no resources shall be allocated in this case that is associated to certificate operations.⌋*(SRS_CryptoStack_00013, SRS_CryptoStack_-00007)*

7.1 Crypto key submodule

The crypto key submodule is used to initialize, update and maintain cryptographic key material for an ECU. One use case is the provision of keys for the secured on-board communication that need to be distributed to the involved ECUs. These keys should

be provided to CSM keys which are assigned to crypto jobs that are used for authentication of Secured I-PDUs. It is therefore crucial from a modelling aspect to assign the keys provided by the key master to the CSM keys and jobs used for the respective Secured-I PDUs. This is an overall task in a vehicle and affects several ECUs in the same way. It is one purpose of the crypto key submodule to support this operation.

The key master can either be located directly in the vehicle to coordinate the key generation internally, e.g. as a particular ECU. It is also possible to use a backend system in the cloud that generates the key material and provides the necessary data in a secure way to the ECUs. Usually diagnostic commands are used for the communication, directly or indirectly, between the key master and the crypto key sub module.

7.1.1 General behavior

[SWS_KeyM_00003] ⌈The crypto key submodule can be configured to perform crypto key operation in a session like manner. In this way, key operation such as KeyM_Prepare() or KeyM_Update() are only accepted during an open session.⌋*(SRS_CryptoStack_00028, SRS_CryptoStack_00103)*

[SWS_KeyM_00004] ⌈A session is started by a call to KeyM_Start(). Afterwards key operations can be performed until the session is closed with a call to the function KeyM_Finalize().⌋*(SRS_CryptoStack_00028)*

[SWS_KeyM_00005] ⌈By default, the KeyM_Start() function will not consider any input data or length information and will not provide any output data nor will the output data length be changed.⌋*(SRS_CryptoStack_00028)*

[SWS_KeyM_00006] ⌈Optionally, a key handler can be called if the configuration option KeyMCryptoKeyHandlerStartFinalizeEnabled is set to TRUE. The KeyM_Start() function will call in turn the KeyM_KH_Start() function with the same parameter of KeyM_Start(). The return value of KeyM_KH_Start() will be used as the return value of KeyM_Start().⌋*(SRS_CryptoStack_00115)*

Rationale:

The KeyM_KH_Start() function can perform OEM specific checks like signature verification of any input data to prove the authenticity for a key management operation.

Note: The definition of KeyMCryptoKeyHandlerStartFinalizeEnabled has only effect if KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE.

[SWS_KeyM_00007] ⌈If the configuration option KeyMCryptoKeyStartFinalizeFunctionEnabled is set to FALSE, the function KeyM_Start() and KeyM_Finalize() are not provided by the Key Management module. A key update operation can then be performed at any time.⌋*(SRS_CryptoStack_00013)*

[SWS_KeyM_00008] ⌈A session is closed by a call to KeyM_Finalize(). During the call, all keys that were updated within the session will be set to valid by calling Csm_Key

SetValid(). After the function has been completed its operation, no further key update operations will be accepted.⌋*(SRS_CryptoStack_00118)*

[SWS_KeyM_00009] ⌈The function KeyM_Finalize() will return E_OK if all keys have been validated successfully. If at least one key could not be validated successfully, the function shall return E_NOT_OK. Nevertheless, all keys shall be validated that have been updated and the operation shall not be aborted if one key validation has failed.⌋ *(SRS_CryptoStack_00119, SRS_CryptoStack_00096)*

[SWS_KeyM_00010] ⌈If the configuration option KeyMCryptoKeyPrepareFunctionEnabled is set to TRUE the function KeyM_Prepare() is provided. This function has currently no functional behavior. If the configuration option is set to FALSE, the functional interface is not provided.⌋*(SRS_CryptoStack_00013)*

[SWS_KeyM_00011] ⌈If the configuration option KeyMCryptoKeyHandlerPrepareEnabled is set to TRUE, then a call to KeyM_Prepare() will in turn passed on to KeyM_KH_Prepare() and the arguments and return value will be passed accordingly.⌋*(SRS_CryptoStack_00108, SRS_CryptoStack_00115, SRS_CryptoStack_00118, SRS_CryptoStack_00110)*

Rationale:

The intention is to call KeyM_Prepare() once at the beginning after the key update session has been initiated. The calling diagnostic service can provide specific data to the key handler which is needed to perform the following key update operation. For example, it could be used to extract crypto driver specific information needed by the key master which is extracted from the (SHE-)hardware and provided in the output buffer back again. Or it can initiate an OEM specific key negotiation process with results that are later on necessary for the key update process. Another possibility would be, that a (encrypted) common key is provided by the key master during preparation. The specific key handler is able to (decrypt and) store the key in the CSM. This results in a common key that is assigned to a CSM key and can further be used to derive other keys from it.

[SWS_KeyM_00012] ⌈A key update is triggered by a call to KeyM_Update(), typically initiated by a diagnostic service.⌋*(SRS_CryptoStack_00107)*

[SWS_KeyM_00013] ⌈If KeyM_Update() is called and KeyMCryptoKeyHandlerUpdateEnabled is set to FALSE and keyNameLength is greater than 0, the crypto key submodule shall search for the key name configured in KeyMCryptoKey/KeyMCryptoKey Name. If the key name is not found, the function shall return KEYM_E_PARAMETER_MISMATCH. If found, the function shall trigger the key update operation.⌋*(SRS_CryptoStack_00113, SRS_CryptoStack_00105)*

[SWS_KeyM_00014] ⌈If KeyM_Update() is called and KeyMCryptoKeyHandlerUpdate Enabled is set to FALSE and keyNameLength is 0, the crypto key submodule will interpret the input data as M1M2M3 values of a [6] "SHE" key. The key_ID is extracted from M1 by extracting bit 121..124 of the input data and will search for the corresponding value in KeyMCryptoKeyCryptoProps to identify the KeyMCryptoKeyId and

the associated CsmKeyRef. If found, the function will trigger the keyupdate operation.⌋ *(SRS_CryptoStack_00118)*

Note: In this case, the CsmKey should be configured as a SHE key. The format should be of algorithm type SHE and the KeyMCryptoKeyGenerationType should be set to KEYM_STORED_KEY.

[SWS_KeyM_00015] ⌈When KeyM_Update() is called and a KeyMCryptoKeyId is found through the provision of the key handler KeyM_KH_Update(), the key generation shall be performed as configured in KeyMCryptoKeyGenerationType. If no associated key was found the KeyM_CryptoKeyUpdateCallbackNotification() function shall be called with KEYM_RT_NOT_OK.⌋ *(SRS_CryptoStack_00119)*

[SWS_KeyM_00016] ⌈If a key ID was identified and KeyMCryptoKeyGenerationType is configured as KEYM_STORED_KEY, the function Csm_KeyElementSet() will be called with the reference to KeyMCryptoKeyCsmKeyTargetRef and key element id '1'. An internal marker will be set for this key that the contents have been altered and need to be finalized.⌋ *(SRS_CryptoStack_00118)*

[SWS_KeyM_00017] ⌈If a key ID was identified and KeyMCryptoKeyGenerationType is configured as KEYM_DERIVE_KEY, the function Csm_KeyDerive() will be called to derive a new key (referenced by KeyMCryptoKeyCsmKeyTargetRef) out of the common key (referenced by KeyMCryptoKeyCsmKeySourceDeriveRef). An internal marker will be set for this key that the contents have been altered and need to be finalized.⌋ *(SRS_CryptoStack_00118)*

[SWS_KeyM_00018] ⌈If the KeyMCryptoKeyStartFinalizeFunctionEnabled is set to FALSE, the function Csm_KeySetValid() shall be called immediately after a successful key derive or store operation.⌋ *(SRS_CryptoStack_00118)*

There are several options on how to operate key updates:

One obvious option is to call the KeyM_Update() function several times, i.e. once per key that shall be updated. The key master will trigger the function call from outside and will provide the key material with every service function. Another possibility is to provide a container with one single call to e.g. KeyM_Prepare() which in turn calls Key M_KH_Prepare(). This allows to provide the container in an OEM specific format. The key handler will scan the container and has to call KeyM_Update() several times for each key available in the container.

[SWS_KeyM_00019] ⌈If the configuration item KeyMCryptoKeyStartFinalizeFunction Enabled is set to TRUE, the crypto key operation has to be concluded with a call to Key M_Finalize(). This function will trigger a call to Csm_KeySetValid() for all keys that have an internal marker set to finalize the key update operation. The key update session is closed after this function call and all internal markers are cleared, regardless if the function call was successful or not.⌋ *(SRS_CryptoStack_00118, SRS_CryptoStack_00119)*

[SWS_KeyM_00020] ⌈If the configuration item KeyMCryptoKeyVerifyFunctionEnabled is set to TRUE, the crypto key submodule shall provide the function KeyM_Verify(). This

function can be triggered by the key master and is used to run a crypto job referenced by KeyMCryptoKeyCsmVerifyJobRef. KeyM_Verify() can be called at any time and is not bound to an active crypto key session.⌋*(SRS_CryptoStack_00119)*

7.2 Certificate Submodule

The certificate submodule functions of KeyM allow BSW modules and SWCs to perform operations with certificates more efficiently and on a central point within [7] "the AUTOSAR software architecture". Examples for such operations are the verification of a complete certificate chain or retrieving elements from a certificate that was provided and verified at runtime.

The required cryptographic operations such as verification of a certificate signature are still performed by associated crypto jobs that are defined in the Crypto Service Manager. Also, the secure storage of certificates can be located in key storage locations of the CSM, e.g. to allow to store the root certificate within the HSM.

7.2.1 General behavior

The certificate submodule allows to define and configure certificates so that they can be stored at production time and further be used for several purposes. The configuration allows to define certificates of a certificate chain in a hierarchical structure with root, intermediate and target certificates used in a PKI system. The stored certificates will be checked at startup according to the configured hierarchy. The configuration allows also to check if specific certificate elements have determined values. There is further support to read specific elements of a certificate and the contained public key can be associated to a CsmKey to use them with configured CSM crypto jobs.

One important part of the specification is therefore the configuration to define the parts of a certificate for flexible and comprehensive verification and for information extraction. The certificates can be associated to KeyMCryptoKey container. This allows a permanent storage of certificates in either NVM or CSM.

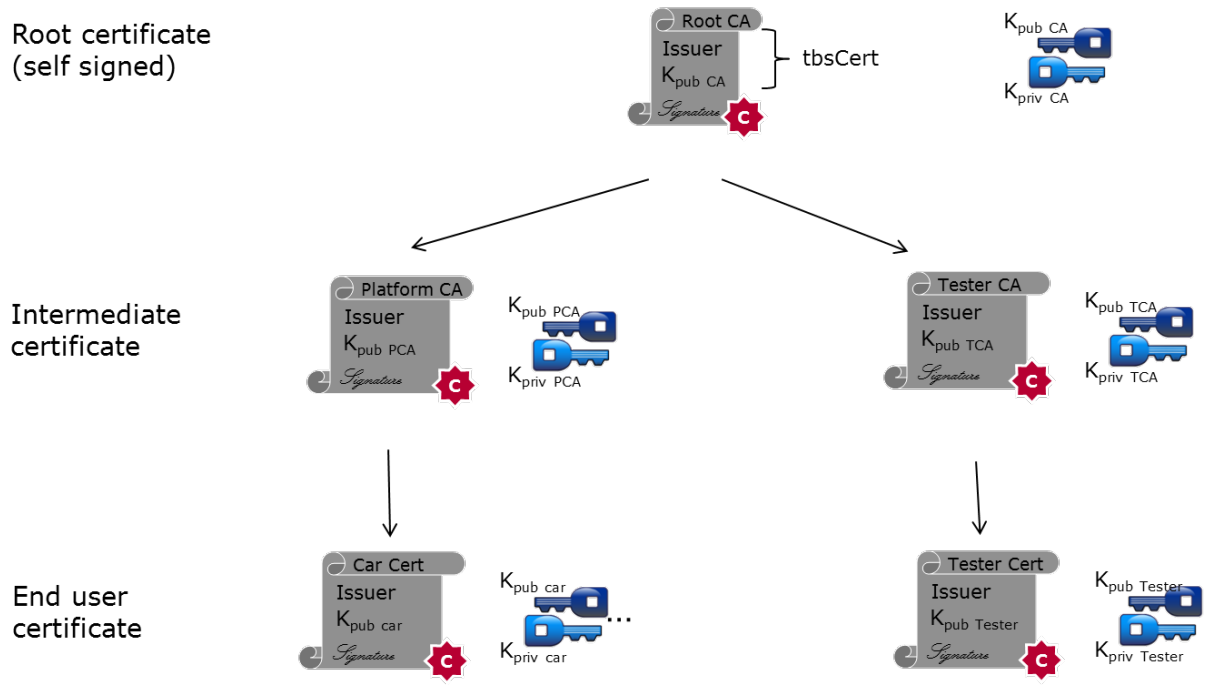

Figure 7.2: Exemplary PKI certificate chain.

Root and intermediate certificates, if required, can be provided in the production phase of the ECU or the vehicle. These certificates will be permanently stored in a specified place. If a certificate is now presented to the ECU, this certificate can be stored in a temporary place to request the verification. The certificate submodule will check for existing certificates in the associated chain and will start to parse the contents, verify them against pre-configured conditions and will then check the signatures against all available certificates in its chain.

7.2.2 Initialization

[SWS_KeyM_00022] ⌈During initialization, the certificate submodule will retrieve the permanently stored certificates, will prepare them for parsing and make them available on demand, e.g. for certificate element extraction or verification against other certificates.⌋*(SRS_CryptoStack_00111, SRS_CryptoStack_00118)*

Optionally, instead of parsing the certificate on every startup, the certificate submodule can parse the certificate once and store the parsed information in a dedicated NVM block. The advantage to store parsing results in NVM would lead to faster startup of the system.

Since parsing and verification of certificates can take a significant amount of time it is recommended to perform this operation for stored certificates in the background task after startup.

[SWS_KeyM_00023] ⌈If the parsing operation was successful, the certificate submodule shall extract the public key from the certificate and shall store it in the provided

key reference of the CSM or in NVM.⌋(*SRS_CryptoStack_00117*, *SRS_CryptoStack_-00118*)

Note: Parsing may contain additional processing when defined by the particular specification. For example, KeyMCertFormatType X509 has to consider X.509 specification, and this also includes ECC SubjectPublicKeyInfo (RFC 5480) that defines compression handling.

7.2.3 Certificate configuration

[SWS_KeyM_00024] ⌈At least one certificate shall be defined as the Root certificate of a PKI. The KeyMCertUpperHierarchicalCertRef of the corresponding KeyMCertificate container is referencing to itself.⌋(*SRS_CryptoStack_00111*)

Rationale:

A root certificate has the characteristics, that the signature is verified with the public key stored in the same certificate (self-signed certificate). It is the top certificate in the hierarchy.

Figure 7-3 shows a configuration of three KeyMCertificate containers in a hierarchal way. It illustrates the configuration of the CSM job and key and the references from the KeyMCertificate. This shows, which CSM job and key are referenced by the containers and which job is used for signature verification.

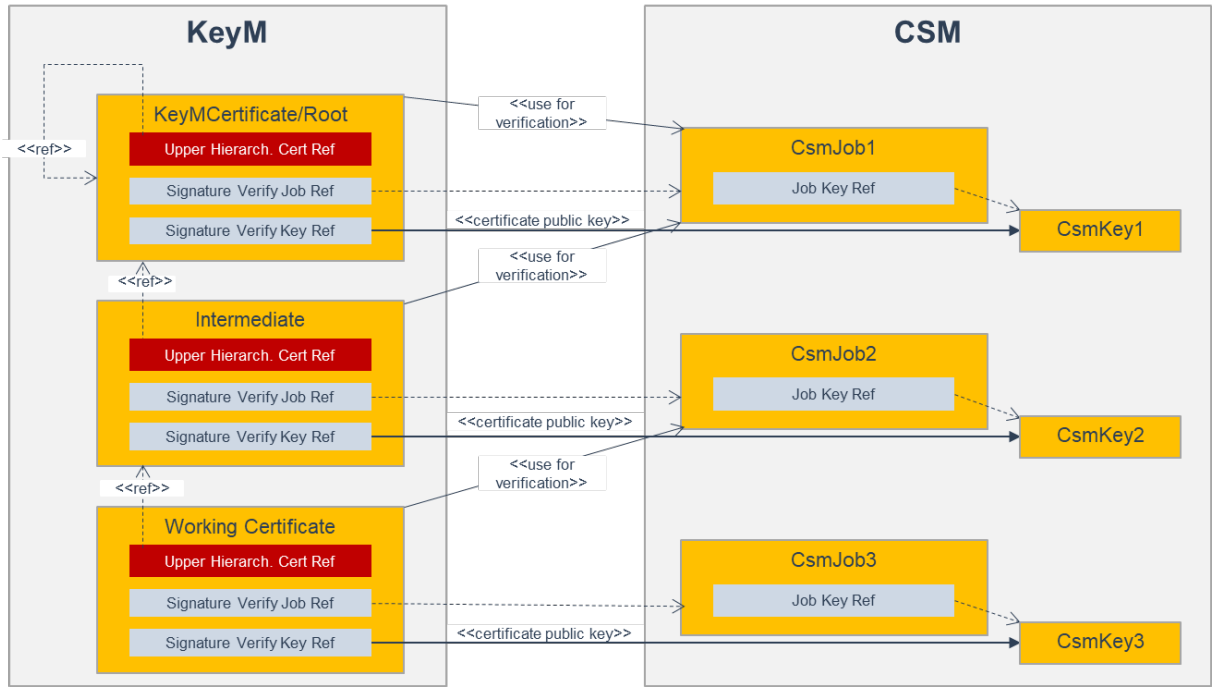

Figure 7.3: Exemplary configuration of a certificate chain in a hierarchy with references to CSM jobs and keys.

[SWS_KeyM_00025] ⌈A certificate is stored for verification with the call of the function KeyM_SetCertificate(). The certificate will be placed in the preconfigured storage class of the KeyMCertificate/KeyMCertificateStorage.⌋ *(SRS_CryptoStack_00120)*

Note:

Such a certificate is typically placed in RAM and is not intended to be used for permanent storage. KeyM_SetCertificate() is just used for the verification of a presented certificate. It is not intended to be used for permanent storage like for example the Root certificate. For operation to store a certificate permanently, the function KeyM_ServiceCertificate{ByCertId}() shall be used.

Certificates can be represented in different formats.

[SWS_KeyM_00175] ⌈The configuration shall support three different formats, [8] the X.509, CVC and CRL.⌋ *(SRS_CryptoStack_00112)*

Key elements that are assigned to certificates can be categorized into basic elements of the structure. This is configured with KeyMCertificateElement/KeyMCertificateElementOfStructure.

The following tables give correspondences of the enum values of KeyMCertificateElementOfStructure to the naming convention of the respective specifications.

7.2.4 Operation mode

[SWS_KeyM_00021] ⌈If the configuration item KeyMServiceCertificateFunctionEnabled and KeyMCertificateManagerEnabled is set to TRUE, the certificate submodule shall provide the function KeyM_ServiceCertificate{ByCertId}(). This function can be triggered by the key master and is used to provide certificate related information to the certificate submodule. Several certificate related operations can be performed like introduction or update of certificates that are permanently stored in the system.⌋ *(SRS_CryptoStack_00080)*

Every certificate that can be addressed by its symbolic name KeyMCertificate/KeyMCertificateId provides a status as defined in KeyM_CertificateStatusType. Each status will be entered by a defined state transition that is outlined in Figure 7-4. The current status of a certificate can be requested by KeyM_CertGetStatus().

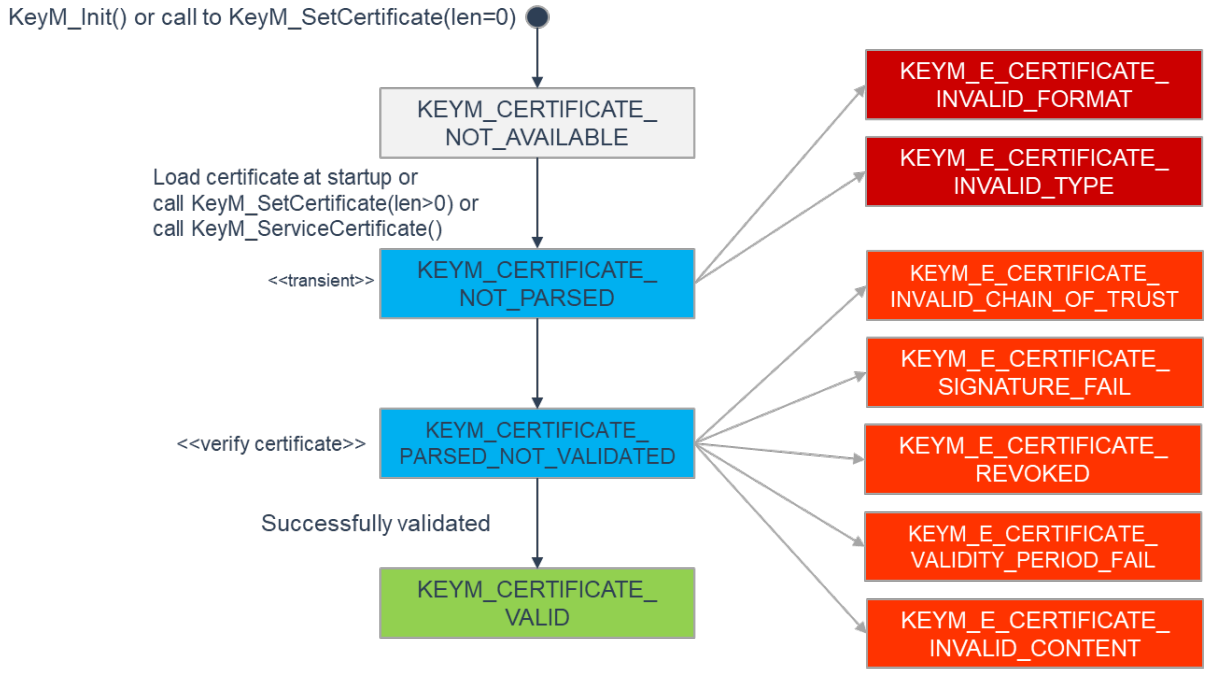

Figure 7.4: Certificate status and possible state transitions.

[SWS_KeyM_00167] ⌈The certificate status "KEYM_CERTIFICATE_NOT_AVAILABLE" is entered after initialization of KeyM. This status can also be entered by a call to KeyM_SetCertificate() with a length value of 0 in certDataLength within the KeyM_CertDataType structure to reset a certificate and its status (see also [SWS_KeyM_00141]).⌋*(SRS_CryptoStack_00115)*

[SWS_KeyM_00026] ⌈The parsing process of a certificate shall be started as soon as the certificate has been stored with either KeyM_SetCertificate() or KeyM_ServiceCertificate{ByCertId}(). When parsing is in progress, the certificate status shall change to the transient status KEYM_CERTIFICATE_NOT_PARSED until the parsing process is completed.

The parsing process can also be already triggered on initialization of KeyM, as outlined in [SWS_KeyM_00022]. In the same way, the certificate status shall change to KEYM_CERTIFICATE_NOT_PARSED.⌋*(SRS_CryptoStack_00117)*

[SWS_KeyM_00027] ⌈If the certificate parse operation detects violations to basic encoding rules on the KeyMCertFormatType such as ASN.1 or TLV (Tag-Length-Values) or violations to any specification relevant for the particular KeyMCertFormatType such as key compression, or if basic elements for that KeyMCertFormatType are missing, the certificate status KEYM_E_CERTIFICATE_INVALID_FORMAT shall be set and reported to the application if required by configured callback. No further operation like parsing and validating shall be performed on this certificate until the status has been reset.⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00168] ⌈If the certificate is in a well-formatted ASN.1 structure but basic elements as outlined in KeyMCertificateElementOfStructure for the specified format type (KeyMCertFormatType) are missing, the certificate status KEYM_E_CER-

TIFICATE_INVALID_TYPE shall be set and reported to the application if required by the configured callback. No further operation like validating shall be performed on this certificate until the status has been reset.⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00169] ⌈If the parsing operation has been completed without failure, the certificate status shall be set to KEYM_CERTIFICATE_PARSED_NOT_VALIDATED and reported to the application if required by the configured callback.⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00028] ⌈A verification of a certificate shall only be started if the certificate is in the status KEYM_CERTIFICATE_PARSED_NOT_VALIDATED. The verification shall be triggered at the latest by a call to one of the functions KeyM_Verify Certificate(), KeyM_VerifyCertificates() or KeyM_VerifyCertificateChain().⌋*(SRS_CryptoStack_00111)*

Note:

It is up to the implementation of a KeyM to start the verification process earlier than by one of these function calls, e.g. in the background after initialization or if a certificate chain needs to be verified.

[SWS_KeyM_00029] ⌈The verification of a certificate shall be done in sequential steps as described in the following requirements. If one step fails, the certificate status shall be set to the corresponding value, it shall be reported through a callback function (if configured) and the verification shall be stopped. The certificate status shall remain in this status until it is reset as outlined in [SWS_KeyM_00167].⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00030] ⌈The verification of a certificate starts with a check if all certificates that are linked with KeyMCertUpperHierarchicalCertRef are in the status KEYM_CERTIFICATE_VALID.

If either of these referenced certificates are in the status KEYM_CERTIFICATE_NOT_PARSED or KEYM_CERTIFICATE_PARSED_NOT_VALIDATED, the parse and/ respectively verification process shall be started for these linked certificates in the order from top (the last one of the linked list that either has no further link or links to itself) down to the bottom (the next certificate that is directly linked with KeyMCertUpperHierarchicalCertRef of the currently processed certificate). In this case, the status check of the linked certificates shall be re-done after all initiated certificate verifications have reached a final status.⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00031] ⌈If all certificates that are linked with KeyMCertUpperHierarchicalCertRef are in the status KEYM_CERTIFICATE_VALID, or KeyMCertUpperHierarchicalCertRef links to itself (self-signed certificates), the subject field of the currently validated certificate shall be verified with the issuer field of the next upper certificate (the one referenced by KeyMCertUpperHierarchicalCertRef).

If one of the checks above have failed, the status KEYM_E_CERTIFICATE_INVALID_CHAIN_OF_TRUST shall be set and reported through callback function (if configured) and the validation process shall stop.

Otherwise, the check outlined in [SWS_KEYM_00032] shall be performed at next.⌋ *(SRS_CryptoStack_00111)*

[SWS_KeyM_00032] ⌈The signature of the certificate shall be verified by using the CSM verify job referenced with KeyMCertUpperHierarchicalCertRef/ KeyMCertCsm SignatureVerifyJobRef (see Figure 7-4). It should be noted, that for self-signed certificates, the public key of this certificate needs to be set and validated in KeyMCert CsmSignatureVerifyKeyRef beforehand.

If the signature verification fails, the certificate status KEYM_E_CERTIFICATE_SIGNATURE_FAIL shall be set and reported through callback function (if configured) and the validation process shall stop.

Otherwise, the check outlined in [SWS_KEYM_00033] shall be performed at next.⌋ *(SRS_CryptoStack_00111)*

[SWS_KeyM_00033] ⌈If the KeyM module maintains revocation lists, it shall check if the certificate under validation is part of the revoked one. If so, the certificate status KEYM_E_CERTIFICATE_REVOKED shall be set and reported through callback function (if configured) and the validation process shall stop.

Otherwise, the check outlined in [SWS_KEYM_00034] shall be performed at next.⌋ *(SRS_CryptoStack_00111)*

[SWS_KeyM_00034] ⌈If the certificate format type contains a time period, the KeyM module shall query the current time from configured time source (KeyMCertTimebase Ref) and compare the current time if it is within the validity period of the certificate. If not, the certificate status KEYM_E_CERTIFICATE_VALIDITY_PERIOD_FAIL shall be set and reported through callback function (if configured) and the validation process shall stop.

Otherwise, the check outlined in [SWS_KEYM_00035] shall be performed at next.⌋ *(SRS_CryptoStack_00111)*

[SWS_KeyM_00035] ⌈The contents of certificate elements shall be checked through by a check of all KeyMCertCertificateElementRuleRef. If one of the rules are violated, the certificate status KEYM_E_CERTIFICATE_INVALID_CONTENT shall be set and reported through callback function (if configured) and the validation process shall stop.

Otherwise, the requirement outlined in [SWS_KeyM_00170] shall be performed.⌋ *(SRS_CryptoStack_00111)*

[SWS_KeyM_00170] ⌈If all verification steps have been performed and no error was detected during the verification, the public key of the certificate shall be set and validated (Csm_KeySetValid()) to the CSM key referenced by KeyMCertCsmSignatureVerifyKeyRef (if not already done for self-signed certificates, see [SWS_KeyM_00032]). The certificate status KEYM_CERTIFICATE_VALID shall be set and reported to the application if required by configured callback.⌋ *(SRS_CryptoStack_00118)*

7.3 Custom Handling

Incoming service requests to KeyM can be processed either locally on KeyM or alternatively on an adapted Crypto Driver (e.g. HSM). This is realized by linking KeyM service requests through custom CSM jobs and APIs to an adapted Crypto driver. The adapted Crypto driver may transfer the requests to HSM. This way the KeyM acts as a proxy and the certificate operations which are configured accordingly are processed completely in the crypto stack (e.g. HSM). The KeyM APIs remain the same, independently if the certificate is handled on KeyM locally or in the Crypto Driver. This has the advantage that serialization and deserialization of passed data is handled completely within Crypto Stack .

To be able to execute the KeyM job as a custom crypto job, a mapping to an asynchronous or synchronous job processing at Csm is provided in a dedicated profile in Crypto (see SWS Crypto Driver Chapter 7.5.2 .<ref>). For KeyM synchronous functions like status requests the Csm_CustomSync function is used. The Crypto Driver profile also defines settings for it.

[SWS_KeyM_00176] ⌈All certificates of a chain shall either by processed by KeyM locally or Csm Custom handling.⌋ *(SRS_CryptoStack_00115, SRS_CryptoStack_00125)*

[SWS_KeyM_00177] ⌈If the configuration container KeyMCertificateCustomService is included to the configuration of a certificate, the certificate submodule shall use the provided Csm Jobs and functions for custom processing (Csm_CustomService and Csm_CustomSync) using the reference definition KeyMCertCsmCustomJobRef.⌋ *(SRS_CryptoStack_00115, SRS_CryptoStack_00125)*

7.3.1 Processing Custom Service Requests

[SWS_KeyM_00178] ⌈The following table shows the provided custom processing functions and their corresponding service requests/functions.⌋ *(SRS_CryptoStack_00115, SRS_CryptoStack_00125)*

KeyM Service Request	***Csm API (Custom Processing Function)***
KeyM_ServiceCertificate	Csm_CustomService
KeyM_ServiceCertificateByCertId	Csm_CustomService
KeyM_VerifyCertificates	Csm_CustomService
KeyM_VerifyCertificate	Csm_CustomService
KeyM_VerifyCertificateChain	Csm_CustomService
KeyM_CertElementGet	Csm_CustomSync
KeyM_CertGetStatus	Csm_CustomSync
KeyM_CertificateElementGetByIndex	Csm_CustomSync
KeyM_CertificateElementGetCount	Csm_CustomSync
KeyM_SetCertificate	Csm_CustomSync
KeyM_GetCertificate	Csm_CustomSync

Note: In case of custom service API is used the APIs KeyM_CertificateElementGet First() and KeyM_CertificateElementGetNext() need to be implemented by usage of KeyM_CertificateElementGetByIndex() and KeyM_CertificateElementGetCount().

7.4 Security Events

[SWS_KeyM_00171] ⌈If security event reporting has been enabled for the KeyM module (KeyMEnableSecurityEventReporting = true) the respective security events shall be reported to [9] "the IdsM" via the interfaces defined in [4] "AUTOSAR_SWS_BSWGeneral".⌋*(RS_Ids_00810)*

The following table lists the security events which are standardized for the KeyM together with their trigger conditions:

[SWS_KeyM_00172] Security events for KeyM ⌈

Name	*Description*	*ID*
KEYM_SEV_INST_ROOT_CERT_OP	Attempt to install a root certificate.	1
KEYM_SEV_UPD_ROOT_CERT_OP	Attempt to update an existing root certificate.	2
KEYM_SEV_INST_INTERMEDIATE_CERT_OP	Attempt to install an intermediate certificate.	3
KEYM_SEV_UPD_INTERMEDIATE_CERT_OP	Attempt to update an intermediate certificate.	4
KEYM_SEV_CERT_VERIF_FAILED	A request to verify a certificate against a certificate chain was not successful.	5

⌋*(RS_Ids_00810)*

[SWS_KeyM_00173] ⌈The following table describes the context data which shall be reported for the respective security event:

⌋*(RS_Ids_00810)*

Security Event	Context Data
KEYM_SEV_INST_ROOT_CERT_OP	Context Data (41 Byte) • Result (1 Byte) – Operation failed: 0x0 – Operation succeeded: 0x1 • HashedID8 of certificate (8 Byte) • certificateIssuerName (32 Byte)
KEYM_SEV_UPD_ROOT_CERT_OP	Context Data (41 Byte) • Result (1 Byte) – Operation failed: 0x0 – Operation succeeded: 0x1 • HashedID8 of certificate (8 Byte) • certificateIssuerName (32 Byte)

▽

△

Security Event	Context Data
KEYM_SEV_INST_INTERMEDIATE_CERT_OP	Context Data (41 Byte) • Result (1 Byte) – Operation failed: 0x0 – Operation succeeded: 0x1 • HashedID8 of certificate (8 Byte) • certificateIssuerName (32 Byte)
KEYM_SEV_UPD_INTERMEDIATE_CERT_OP	Context Data (41 Byte) • Result (1 Byte) – Operation failed: 0x0 – Operation succeeded: 0x1 • HashedID8 of certificate (8 Byte) • certificateIssuerName (32 Byte)
KEYM_SEV_CERT_VERIF_FAILED	Context Data (41 Byte) • Result (1 Byte) – E_NOT_OK: 0x0 – KEYM_E_BUSY: 0x1 – KEYM_E_PARAMETER_MISMATCH: 0x05 – KEYM_E_KEY_CERT_EMPTY: 0x0A – KEYM_E_CERT_INVALID_CHAIN_OF_TRUST: 0x0B • HashedID8 of certificate (8 Byte) • certificateIssuerName (32 Byte)

7.5 Error Classification

Section "Error Handling" of the document [4] "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.5.1 Development Errors

[SWS_KeyM_00036] ⌈

Type of error	*Related error code*	*Error value*
API service called with invalid parameter (Null Pointer)	KEYM_E_PARAM_POINTER	0x01
Buffer is too small for operation	KEYM_E_SMALL_BUFFER	0x02
API called before module has been initialized	KEYM_E_UNINIT	0x03
KeyM module initialization failed	KEYM_E_INIT_FAILED	0x04
KeyM configuration failure	KEYM_E_CONFIG_FAILURE	0x05

⌋*(SRS_CryptoStack_00086, SRS_BSW_00170, SRS_BSW_00331, SRS_BSW_00369, SRS_BSW_00385, SRS_BSW_00386)*

7.5.2 Runtime Errors

There are no runtime errors.

7.5.3 Transient Faults

There are no transient faults.

7.5.4 Production Errors

There are no production errors.

7.5.5 Extended Production Errors

There are no extended production errors.

7.6 Error detection

[SWS_KeyM_00144] ⌈If development errors are active the Key Manager shall check on every function call if the module has been initialized with KeyM_Init() and not yet been de-initialized with KeyM_Deinit(). Otherwise, the Development error KEYM_E_UNINIT shall be set.⌋*(SRS_CryptoStack_00087, SRS_BSW_00487, SRS_BSW_00350)*

[SWS_KeyM_00145] ⌈If development errors are active the Key Manager shall check on every function where result buffers are provided if the provided buffer is large enough to store the requested result. If not, the development error KEYM_E_SMALL_BUFFER shall be set.⌋*(SRS_CryptoStack_00087)*

[SWS_KeyM_00146] ⌈If development errors are active the Key Manager shall check on every function where pointers are provided if the pointer is not a NULL_PTR. If a NULL_PTR is provided but not expected, the development error KEYM_E_PARAM_POINTER shall be set.⌋ *(SRS_CryptoStack_00087, SRS_BSW_00480)*

8 API specification

8.1 Imported types

In this chapter all types included from the following files are listed.

[SWS_KeyM_00037] ⌈

Module	*Header File*	*Imported Type*
Csm	Rte_Csm_Type.h	Crypto_OperationModeType
	Rte_Csm_Type.h	Crypto_VerifyResultType
IdsM	IdsM_Types.h	IdsM_SecurityEventIdType
StbM	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_TimeTupleType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

⌋(*SRS_CryptoStack_00118*, *SRS_CryptoStack_00087*, *SRS_CryptoStack_00122*, *SRS_BSW_00383*, *SRS_BSW_00384*)

8.2 Type definitions

8.2.1 KeyM_ConfigType

[SWS_KeyM_00157] ⌈

Name	KeyM_ConfigType	
Kind	Structure	
Elements	Implementation specific	
	Type	–
	Comment	The content of this data structure is implementation specific
Description	This structure is the base type to initialize the Key Manager module. A pointer to an instance of this structure will be used in the initialization of the Key Manager module.	
Available via	KeyM.h	

⌋(*SRS_BSW_00404*, *SRS_BSW_00345*)

8.2.2 KeyM_KH_UpdateOperationType

[SWS_KeyM_00055] ⌈

Name	KeyM_KH_UpdateOperationType		
Kind	Enumeration		
Range	KEYM_KH_UPDATE_KEY_UPDATE_REPEAT	0x01	Key handler has successfully performed the operation and provides new key data that shall be further operated by the update function of the key manager. A next call to key handler is requested.
	KEYM_KH_UPDATE_FINISH	0x02	Key handler has successfully performed all update operation. The update operation is finished and the result data can be provided back for a final result of the KeyM_Update operation.
Description	Specifies the type of key handler update operation that was performed in the callback.		
Available via	KeyM.h		

⌋(*SRS_CryptoStack_00107*)

8.2.3 KeyM_CertElementIteratorType

[SWS_KeyM_00042] ⌈

Name	KeyM_CertElementIteratorType	
Kind	Structure	
Elements	Implementation specific	
	Type	–
	Comment	The content of this data structure is implementation specific
Description	This structure is used to iterate through a number of elements of a certificate.	
Available via	KeyM.h	

⌋(*SRS_CryptoStack_00112*)

8.2.4 KeyM_CryptoKeyIdType

[SWS_KeyM_00302] ⌈

Name	KeyM_CryptoKeyIdType
Kind	Type
Derived from	uint16
Description	Crypto key handle.
Available via	KeyM.h

⌋(*SRS_CryptoStack_00011*)

8.2.5 KeyM_CertDataPointerType

[SWS_KeyM_91011] ⌈

Name	KeyM_CertDataPointerType
Kind	Pointer
Type	uint8*
Description	Byte-pointer to the data of the certificate
Available via	KeyM.h

⌋(*SRS_CryptoStack_00112*)

8.2.6 Extension to Std_ReturnType

The Key Management module uses the following extension to the Std_ReturnType:

[SWS_KeyM_00040] ⌈

Range	KEYM_E_BUSY	0x02	Key management is busy with other operations.
	KEYM_E_PENDING	0x03	Operation request accepted, response is pending. It runs now in asynchronous mode, response will be given through callback.
	KEYM_E_KEY_CERT_SIZE_MISMATCH	0x04	Parameter size does not match the expected value.
	KEYM_E_PARAMETER_MISMATCH	0x05	Parameter to function does not provide the expected value.
	KEYM_E_KEY_CERT_INVALID	0x06	Key or certificate is invalid and cannot be used for the operation.
	KEYM_E_KEY_CERT_WRITE_FAIL	0x07	Certificate or key write operation failed.
	KEYM_E_KEY_CERT_UPDATE_FAIL	0x08	Key or certificate update operation failed.
	KEYM_E_KEY_CERT_READ_FAIL	0x09	Certificate or key could not be provided due to a read or permission failure.
	KEYM_E_KEY_CERT_EMPTY	0x0A	The requested key or certificate is not available, slot is empty.
	KEYM_E_CERT_INVALID_CHAIN_OF_TRUST	0x0B	Certificate verification failed - Invalid Chain of Trust
Description	Key management specific return values for use in Std_ReturnType.		
Available via	KeyM.h		

⌋(*SRS_CryptoStack_00096, SRS_BSW_00377*)

8.3 Function definitions

This is a list of functions provided to upper layer modules.

8.3.1 General

8.3.1.1 KeyM_Init

[SWS_KeyM_00043] ⌈

Service Name	KeyM_Init	

Syntax	`void KeyM_Init (`
	`  const KeyM_ConfigType* ConfigPtr`
	`)`	

Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	ConfigPtr	Pointer to the configuration set in VARIANT-POST-BUILD.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function initializes the key management module.	
Available via	KeyM.h	

⌋(*SRS_BSW_00101*, *SRS_BSW_00358*, *SRS_BSW_00414*, *SRS_BSW_00310*, *SRS_BSW_00485*)

[SWS_KeyM_00158] ⌈The Configuration pointer configPtr shall always have a NULL_PTR value.⌋(*SRS_BSW_00414*)

Note: A Configuration of the Key Manager at initialization is currently not used and shall therefore pass a NULL_PTR to the module.

[SWS_KeyM_00044] ⌈If the initialization of the key management module fails and development errors are activated, the error KEYM_E_INIT_FAILED shall be reported to the DET.⌋(*SRS_CryptoStack_00087*)

[SWS_KeyM_00045] ⌈If the certificate submodule is active and permanently stored certificates are available in unparsed and unverified state, the KeyM certificate submodule part shall start a background task to pre-parse and pre-verify certificates.⌋(*SRS_CryptoStack_00031*, *SRS_CryptoStack_00111*)

Rationale: The operation can be done in a background task if CPU time is available,

Pre-validating certificates will help to speed-up the authentication when a certificate is presented and shall be verified at runtime against a pre-installed certificate chain.

[SWS_KeyM_00046] ⌈If the crypto key submodule is active, all keys stored in NVM shall be read from and stored to CSM (RAM-) key slots during initialization.⌋(*SRS_CryptoStack_00114*, *SRS_CryptoStack_00118*)

8.3.1.2 KeyM_Deinit

[SWS_KeyM_00047] ⌈

Service Name	KeyM_Deinit

Syntax	`void KeyM_Deinit (`
	`  void`
	`)`

Service ID [hex]	0x02
Sync/Async	Synchronous
Reentrancy	Non Reentrant
Parameters (in)	None
Parameters (inout)	None
Parameters (out)	None
Return value	None
Description	This function resets the key management module to the uninitialized state.
Available via	KeyM.h

⌋(*SRS_CryptoStack_00120*, *SRS_CryptoStack_00100*, *SRS_BSW_00310*)

[SWS_KeyM_00048] ⌈For security reason the crypto key submodule shall actively destroy all data in RAM that was used for cryptographical key material. Especially symmetric keys and intermediate results shall be set to an initial value.⌋(*SRS_CryptoStack_00120*)

8.3.1.3 KeyM_GetVersionInfo

[SWS_KeyM_00049] ⌈

Service Name	KeyM_GetVersionInfo	

Syntax	`void KeyM_GetVersionInfo (`
	`  Std_VersionInfoType* VersionInfo`
	`)`	

Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	VersionInfo	Pointer to the version information of this module.
Return value	None	
Description	Provides the version information of this module.	
Available via	KeyM.h	

⌋(*SRS_BSW_00407*, *SRS_BSW_00310*, *SRS_BSW_00482*)

8.3.2 Crypto key operation

8.3.2.1 KeyM_Start

[SWS_KeyM_00050] ⌈

Service Name	KeyM_Start	

Syntax	`Std_ReturnType KeyM_Start (`
	`  KeyM_StartType StartType,`
	`  const uint8* RequestData,`
	`  uint16 RequestDataLength,`
	`  uint8* ResponseData,`
	`  uint16* ResponseDataLength`
	`)`	

Service ID [hex]	0x04	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	StartType	Defines in which mode the key operation shall be executed.
	RequestData	Information that comes along with the request, e.g. signature
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Start operation successfully performed. Key update operations are now allowed. E_NOT_OK: Start operation not accepted. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	This function is optional and only used if the configuration item KeyMCryptoKeyStartFinalizeFunctionEnabled is set to true. It intents to allow key update operation.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00486)*

[SWS_KeyM_00085] ⌈If KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE, this function shall be called to initiate a key update session. The function indicates with E_OK that key operations are now possible.⌋*(SRS_CryptoStack_00028, SRS_CryptoStack_00096)*

[SWS_KeyM_00086] ⌈If a key update session is already active and the function is called with the same parameter, this function shall return with E_OK and continue to accept key update operations.⌋*(SRS_CryptoStack_00028, SRS_CryptoStack_00096)*

[SWS_KeyM_00087] ⌈By default, the KeyM_Start() function does not check Request Data length or values. It will accept every function call with valid startTypes to initiate key update sessions.⌋*(SRS_CryptoStack_00107)*

[SWS_KeyM_00088] ⌈OEM or security specific checks for the start operation shall be performed in the corresponding key handler operation.⌋*(SRS_CryptoStack_00115)*

8.3.2.2 KeyM_Prepare

[SWS_KeyM_00051] ⌈

Service Name	KeyM_Prepare	
Syntax	`Std_ReturnType KeyM_Prepare ( const uint8* RequestData, uint16 RequestDataLength, uint8* ResponseData, uint16* ResponseDataLength )`	
Service ID [hex]	0x05	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Service has been accepted and will be processed internally. Results will be provided through a callback E_NOT_OK: Service not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	This function is used to prepare a key update operation. The main intent is to provide information for the key operation to the key server. Other operations may start the negotiation for a common secret that is used further to derive key material. This function is only available if KeyMCryptoKeyPrepareFunctionEnabled is set to TRUE.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00109, SRS_CryptoStack_00107, SRS_CryptoStack_00110, SRS_CryptoStack_00100, SRS_CryptoStack_00029, SRS_CryptoStack_00010, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00486, SRS_CryptoStack_00116)*

[SWS_KeyM_00089] ⌈The function KeyM_Prepare() is provided when KeyMCrypto KeyPrepareFunctionEnabled is set to TRUE. There is no dedicated implementation, but a key handler can be used to provide specific information to the key server that is required to generate key material. Such information or further operation can be performed through the key handler callback KeyM_KH_Prepare() when enabled, e.g. providing SHE information or generating secret key generation operations.⌋*(SRS_CryptoStack_00107, SRS_CryptoStack_00109, SRS_CryptoStack_00115, SRS_CryptoStack_00027)*

[SWS_KeyM_00090] ⌈By default, the function returns E_NOT_OK. If a key handler is configured to be called, this function will call the key handler with the exact parameter and will pass the return value of this key handler back to the caller.⌋*(SRS_CryptoStack_00096)*

8.3.2.3 KeyM_Update

[SWS_KeyM_00052] ⌈

Service Name	KeyM_Update	
Syntax	`Std_ReturnType KeyM_Update ( const uint8* KeyNamePtr, uint16 KeyNameLength, const uint8* RequestDataPtr, uint16 RequestDataLength, uint8* ResultDataPtr, uint16 ResultDataMaxLength )`	
Service ID [hex]	0x06	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	KeyNamePtr	Pointer to an array that defines the name of the key to be updated
	KeyNameLength	Specifies the number of bytes in keyName. The value 0 indicates that no keyName is provided within this function.
	RequestDataPtr	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
	ResultDataMaxLength	Max number of bytes available in ResultDataPtr.
Parameters (inout)	None	
Parameters (out)	ResultDataPtr	Pointer to a data buffer used by the function to store results.
Return value	Std_ReturnType	E_OK: Service has been accepted and will be processed internally. Results will be provided through a callback E_NOT_OK: Service not accepted due to an internal error. E_BUSY: Service could not be accepted because another operation is already ongoing. Try next time. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	This function is used to initiate the key generation or update process.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00113, SRS_CryptoStack_00107, SRS_CryptoStack_00029, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00486, SRS_CryptoStack_00116)* By the call of this function a key update operation is requested.

[SWS_KeyM_00091] ⌈If a KeyName is provided the Key Manager shall search for an element in the container that matches /KeyMCryptoKey/KeyMCryptoKeyName. If found, the CryptoKeyId shall be used as KeyID and this container shall be used for reference of any further key update operation (derive or store the key value).⌋*(SRS_CryptoStack_00113, SRS_CryptoStack_00105, SRS_CryptoStack_00027, SRS_CryptoStack_00010)*

[SWS_KeyM_00154] ⌈If either KeyNamePtr is not valid or KeyNameLength is 0 and KeyMCryptoKeyCryptoProps is defined then the Key Manager shall interpret the RequestData as M1M2M3 values of a SHE key. The Key Manager shall extract bits 121..124 located in RequestDataPtr (if RequestDataLength indicates enough data) and shall check for a corresponding value in KeyMCryptoKeyCryptoProps. If a matching value is found then CryptoKeyId of this container shall be used as KeyID and this con-

tainer shall be used for reference of any further key update operation (derive or store the key value).⌋*(SRS_CryptoStack_00114)*

[SWS_KeyM_00155] ⌈If a KeyID could not be identified and KeyMCryptoKeyHandler UpdateEnabled is set to FALSE then KeyM_Update() shall not perform a key update operation and shall return KEYM_E_PARAMETER_MISMATCH.⌋*(SRS_CryptoStack_00086, SRS_CryptoStack_00096)*

[SWS_KeyM_00092] ⌈If KeyMCryptoKeyHandlerUpdateEnabled is set to TRUE to perform a key handler operation then KeyM_Update() shall call KeyM_KH_Update(). The parameter RequestDataPtr, RequestDataLength, KeyName and KeyNameLength shall be passed on to the key handler. If a KeyMCryptoKey container was identified in one of the previous steps then the KeyMCryptoKeyID shall be provided with the KeymId parameter. Otherwise, the value 0xFFFF shall be used.⌋*(SRS_CryptoStack_00107)*

[SWS_KeyM_00098] ⌈If no key handler is configured for the key update operation (KeyMCryptoKeyHandlerUpdateEnabled is set to FALSE) and a CryptoKey container was identified, a key update operation shall be performed according to the configuration (derive or store key in CSM). stored according to the configuration. Thus, if Key MCryptoKeyStorage is set to KEYM_STORAGE_IN_NVM is set, the ResultData and length for this key ID shall be stored in the configured NVM block. Otherwise, if KEYM_ STORAGE_IN_CSM is set, the CSM is responsible to store the key data after it has been set.⌋*(SRS_CryptoStack_00117, SRS_CryptoStack_00118)*

[SWS_KeyM_00099] ⌈If a key was identified by its ID and either RequestDataPtr and RequestDataLength indicates data or KeyM_KH_Update() has returned E_OK and ResultDataPtr and ResultDataLengthPtr indicates data and the configuration /Key MCryptoKey/KeyMCryptoKeyGenerationType is set to KEYM_STORED_KEY, then this function shall call Csm_KeyElementSet() to provide the data to CSM. The key element ID is always 1 and the KeyMCryptoKeyCsmKeyTargetRef is used to identify the target key.⌋*(SRS_CryptoStack_00096, SRS_CryptoStack_00107)*

[SWS_KeyM_00100] ⌈If a CryptoKey container was found and either RequestData Ptr and RequestDataLength provides data or KeyM_KH_Update() has returned E_OK and ResultDataPtr and ResultDataLengthPtr provides data and the configuration /Key MCryptoKey/KeyMCryptoKeyGenerationType is set to KEYM_DERIVE_KEY, then the data shall be set to the key element CRYPTO_KE_KEYDERIVATION_PASSWORD. If the configuration value KeyMCryptoKeyGenerationInfo is set, then this value shall be used as the salt for the target key and shall set the value to the key element ID CRYPTO_KE_KEYDERIVATION_SALT. The KeyMCryptoKeyCsmKeyTargetRef is used to identify the target key and KeyMCryptoKeyCsmKeySourceDeriveRef as the source key for the derivation and the function Csm_KeyDerive() shall be called accordingly.⌋*(SRS_CryptoStack_00107, SRS_CryptoStack_00027)*

[SWS_KeyM_00101] ⌈If a key update operation was successful and KeyMCryptoKey StartFinalizeFunctionEnabled is set to FALSE, then the function Csm_KeySetValid() shall be called immediately after the key element has been successfully set in CSM.⌋ *(SRS_CryptoStack_00107)*

[SWS_KeyM_00102] ⌈If a key update operation was successfully performed through CSM operation and KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE, then a flag shall be set for this key to indicate, that Csm_KeySetValid() for the key shall be called during finalization of the key update operation.⌋*(SRS_CryptoStack_00107)*

[SWS_KeyM_00094] ⌈KeyM_Update() runs in asynchronous mode. Note that the key handler KeyM_KH_Update() is called in synchronous mode. It shall be called therefore from within the background task.⌋*(SRS_CryptoStack_00101)*

[SWS_KeyM_00095] ⌈If a single key update operation was finished with success or a key update operation has failed because a function call to CSM or key handler has not returned E_OK or KeyM_KH_Update() has provided the operation type KEYM_KH_UPDATE_FINISH, the callback function KeyM_CryptoKeyUpdateCallbackNotification() has to be called.⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00107)*

[SWS_KeyM_00156] ⌈The function that calls KeyM_Update() shall provide a pointer to a buffer with ResultDataPtr. If KeyM_Update() accepts the operation by returning E_OK the function shall not touch this buffer until the callback notification KeyM_CryptoKeyUpdateCallbackNotification() has been called. Any results from the KeyM_Update() operation will be copied into this buffer. The same buffer pointer provided with the call to KeyM_Update() (ResultDataPtr) will be provided as ResultDataPtr with the callback notification. The callback also indicates the length of the result data and the overall result of the update operation.⌋*(SRS_CryptoStack_00107, SRS_CryptoStack_00106)*

Info:

The result data is either the result from the key handler or, if no key handler is used, contains the M4M5 for a SHE key.

8.3.2.4 KeyM_Finalize

[SWS_KeyM_00053] ⌈

Service Name	KeyM_Finalize	
Syntax	`Std_ReturnType KeyM_Finalize ( const uint8* RequestDataPtr, uint16 RequestDataLength, uint8* ResponseDataPtr, uint16 ResponseMaxDataLength )`	
Service ID [hex]	0x07	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	RequestDataPtr	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
	ResponseMaxDataLength	Max number of bytes available in ResponseDataPtr
Parameters (inout)	None	
Parameters (out)	ResponseDataPtr	Data returned by the function.

▽

△

Return value	Std_ReturnType	E_OK: Operation has been accepted and will be processed internally. Results will be provided through a callback E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	The function is used to finalize key update operations. It is typically used in conjunction with the KeyM_Start operation and returns the key operation into the idle mode. Further key prepare or update operations are not accepted until a new KeyM_Start operation has been initialized. This function is only available if KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE. In addition, updated key material will be persisted and set into valid state (calling Csm_KeySet Valid).	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101, SRS_CryptoStack_00107, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00486)*

[SWS_KeyM_00103] ⌈If KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE, this function will conclude the key update operation. All keys that have flagged to be updated during the session shall be finalized by calling Csm_KeySetValid().

The validation shall be done for all keys that have been updated, even if Csm_KeySet Valid() returns a failure for one of the keys. This is to finalize as much keys as possible even if one key fails. If at least one key fails, then the overall result is a fail information in the callback result.⌋*(SRS_CryptoStack_00107)*

[SWS_KeyM_00104] ⌈If KeyMCryptoKeyStartFinalizeFunctionEnabled and Key MCryptoKeyHandlerStartFinalizeEnabled is set to TRUE this function will call KeyM_ KH_Finalize() with the exact same parameter as provided with KeyM_Finalize(). The finalize key handler has to be called BEFORE the validation of the key (the call to Csm_ KeySetValid()). If the key handler returns E_OK, then this function will continue its operation as specified. If the key handler finalization function returns E_NOT_OK, then no validation shall be done.⌋*(SRS_CryptoStack_00096, SRS_CryptoStack_00107)*

[SWS_KeyM_00105] ⌈The callback function KeyM_CryptoKeyFinalizeCallbackNotification() will be called if the operation has finished. The parameter 'ResultDataPtr' of this callback shall provide the buffer pointer 'ResponseDataPtr' provided with the call to KeyM_Finalize(). The result information provides the residual result of the validation of all keys.⌋*(SRS_CryptoStack_00106)*

Info:

Since key validation can take considerable amount of time this function is used in asynchronous mode only. Since the key handler is called in synchronous mode it is recommended to call it not from within KeyM_Finalize() but delegate the call to the background task.

The caller of KeyM_Finalize() shall provide a buffer that is large enough to store the response. This buffer shall not be touched by the caller if KeyM_Finalize() returns E_ OK until the callback notification has indicated the end of the finalize operation.

[SWS_KeyM_00106] ⌈At the end of a key finalize operation, all flags for key validation have to be cleared and the session state shall be set to the init mode. Thus, no further key update operations are allowed anymore.⌋ *(SRS_CryptoStack_00120)*

8.3.2.5 KeyM_Verify

[SWS_KeyM_00054] ⌈

Service Name	KeyM_Verify	

Syntax	`Std_ReturnType KeyM_Verify (`
	`  const uint8* KeyNamePtr,`
	`  uint16 KeyNameLength,`
	`  const uint8* RequestData,`
	`  uint16 RequestDataLength,`
	`  uint8* ResponseData,`
	`  uint16* ResponseDataLength`
	`)`	

Service ID [hex]	0x08	
Sync/Async	Synchronous Synchronous/Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	KeyNamePtr	Points to an array that defines the name of the key to be updated
	KeyNameLength	Specifies the number of bytes in KeyNamePtr. The value 0 indicates that no KeyNamePtr is provided within this function.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData or left untouched if service runs in asynchronous mode and function returns KEYM_E_PENDING
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	KEYM_E_PENDING: Operation runs in asynchronous mode, has been accepted and will be processed internally. Results will be provided through callback E_OK: Operation was successfully performed. Result information are available. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs (for asynchronous mode). KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match KEYM_E_KEY_CERT_INVALID: Key operation cannot be performed because the key name is invalid. KEYM_E_KEY_CERT_EMPTY: The key for this slot has not been set.
Description	The key server requests to verify the provided keys. The key manager performs operation on the assigned job and returns the result to the key server who verifies if the results was provided with this key as expected. This function is only available if KeyMCryptoKeyVerifyFunction Enabled is set to TRUE.	
Available via	KeyM.h	

⌋ *(SRS_CryptoStack_00114, SRS_CryptoStack_00117, SRS_CryptoStack_00101, SRS_CryptoStack_00119, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00486)*

[SWS_KeyM_00107] ⌈If KeyMCryptoKeyVerifyFunctionEnabled is set to TRUE this function is available to perform a verification of a key. This function can always be called and is not bound to a key update session.⌋*(SRS_CryptoStack_00119)*

[SWS_KeyM_00108] ⌈If KeyMCryptoKeyVerifyAsyncMode is set to FALSE, the function will use KeyMCryptoKey/KeyMCryptoKeyCsmKeyVerifyJobRef to perform a crypto operation. If specified then the configuration KeyMCryptoCsmVerifyJobType shall be specified as well to identify which job shall be called.⌋*(SRS_CryptoStack_00119, SRS_CryptoStack_00022)*

Info:

Since only one input and output buffer is specified, only MAC generate and data decrypt/encrypt operations can be done autonomously in this function. Other operations such as AEAD encrypt/decrypt or MAC verify requires interpretation of structured RequestData which needs to be interpreted in the key handler verification function.

[SWS_KeyM_00109] ⌈If KeyMCryptoKeyVerifyAsyncMode is set to TRUE, the function will run in asynchronous mode. The direct function call will return KEYM_E_PENDING if the job was accepted or any other return value if the job could not be accepted.

In asynchronous mode, the KeyM_CryptoKeyVerifyCallbackNotification will provide the result of the crypto job operation.⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101)*

Info:

This is especially useful if at least one CSM verify job is configured for asynchronous operation. Ideally, the verification is initiated in the background task.

8.3.3 Certificate handling

8.3.3.1 KeyM_ServiceCertificate

[SWS_KeyM_00056] ⌈

Service Name	KeyM_ServiceCertificate

Syntax	`Std_ReturnType KeyM_ServiceCertificate (`
	`  KeyM_ServiceCertificateType Service,`
	`  const uint8* CertNamePtr,`
	`  uint32 CertNameLength,`
	`  const uint8* RequestData,`
	`  uint32 RequestDataLength,`
	`  uint8* ResponseData,`
	`  uint32 ResponseDataLength`
	`)`

Service ID [hex]	0x09
Sync/Async	Asynchronous
Reentrancy	Non Reentrant

▽

△

Parameters (in)	Service	Provides the type of service the key manager has to perform.
	CertNamePtr	Points to an array that defines the name of the certificate to be updated
	CertNameLength	Specifies the number of bytes in CertNamePtr. The value 0 indicates that no CertNamePtr is provided within this function.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
	ResponseDataLength	Max number of bytes available in ResponseDataPtr.
Parameters (inout)	None	
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Service data operation successfully accepted. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match KEYM_E_BUSY Certificate service cannot be executed, operation is busy.
Description	The key server requests an operation from the key client. The type of operation is specified in the first parameter KeyM_ServiceCertificateType. Certificate operation requests are operated through this function. This function is only available if the configuration parameter KeyMService CertificateFunctionEnabled is set to TRUE.	
Available via	KeyM.h	

⌋(*SRS_CryptoStack_00106*, *SRS_CryptoStack_00101*, *SRS_BSW_00357*, *SRS_BSW_00484*, *SRS_BSW_00486*)

[SWS_KeyM_91016] ⌈

Service Name	KeyM_ServiceCertificateByCertId	

Syntax	`Std_ReturnType KeyM_ServiceCertificateByCertId (`
	`  KeyM_CertificateIdType CertId,`
	`  KeyM_ServiceCertificateType Service,`
	`  const uint8* RequestData,`
	`  uint32 RequestDataLength,`
	`  uint8* ResponseData,`
	`  uint32 ResponseDataLength`
	`)`	

Service ID [hex]	0x13	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the certificate.
	Service	Provides the type of service the key manager has to perform.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	None	
Parameters (out)	ResponseData	Data returned by the function.
	ResponseDataLength	Max number of bytes available in ResponseDataPtr.

▽

△

Return value	Std_ReturnType	E_OK: Service data operation successfully accepted. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match. KEYM_E_BUSY Certificate service cannot be executed, operation is busy.
Description	The key server requests an operation from the key client. The type of operation is specified in the parameter KeyM_ServiceCertificateType. Certificate operation requests are operated through this function. This function is only available if the configuration parameter KeyMService CertificateFunctionEnabled is set to TRUE. This function is identical to the function KeyM_ServiceCertificate(), but uses already the certificate identifier as parameter. In consequence there is no need to search the configured certificate by its name.	
Available via	KeyM.h	

⌋()

[SWS_KeyM_00110] ⌈If KeyMServiceCertificateFunctionEnabled is set to TRUE, this service function is provided to update certificates or certificate information. The type of operation is specified by the Service parameter.⌋(*SRS_CryptoStack_00111*)

[SWS_KeyM_00111] ⌈A service certificate key handler can be configured to defer the service operation. If KeyMCryptoKeyHandlerServiceCertificateEnabled is set to TRUE, this function will directly call the service certificate key handler by passing the exact parameter to the handler. It will also return the value returned by the handler and no further operation will be performed.⌋(*SRS_CryptoStack_00111*)

[SWS_KeyM_00112] ⌈If KeyMCryptoKeyHandlerServiceCertificateEnabled is set to FALSE, the service certificate function will check for the requested service and will perform the requested operation by first searching for a configured certificate by its name.⌋(*SRS_CryptoStack_00111*)

[SWS_KeyM_00113] ⌈Depending on the Service parameter the following services shall be offered. See 8.1 for the detailed listing. The implementation of either or all of the services are optional.⌋(*SRS_CryptoStack_00023, SRS_CryptoStack_00111, SRS_CryptoStack_00061*)

KEYM_SERVICE_CERT_REQUEST_CSR	Key server requests a certificate signing request. Service certificate shall generate a certificate according to the format, will generate a key pair, either as RSA or ECC, and will store the values in the configured container. The generated certificate will be provided to the key server.
KEYM_SERVICE_CERT_UPDATE_SIGNED_CSR	The key server has modified and signed the certificate. It is provided back and this function stores now the valid certificate in the configured storage.
KEYM_SERVICE_CERT_SET_ROOT	The key server requests to store a root certificate. The service checks if the certificate slot is empty and if so will validate the root certificate according to the configured rule and will store the root certificate

▽

△

KEYM_SERVICE_CERT_UPDATE_ROOT	The key server requests to update an existing root certificate. The service checks if a root certificate exists and verifies the new root certificate against the already existing ones. If the validation was successful, the root certificate is re-newed in the slot.
KEYM_SERVICE_CERT_SET_INTERMEDIATE	The key server requests to store an intermediate certificate. A root certificate shall already exist to allow to validate the intermediate certificate against the root certificate and other certificates that might exist in the chain. The certificate slot is checked to be empty. If the validation was successful, the certificate is stored in the slot.
KEYM_SERVICE_CERT_UPDATE_INTERMEDIATE	The key server requests to update an intermediate certificate. It is verified against the root certificate and other certificates that might exist in the chain. If the validation was successful the certificate is updated.
KEYM_SERVICE_CERT_UPDATE_CRL	The key server provides a certificate revocation list. The service checks the signature of the list and stores it in the slot if the validation was successful. The revocation list shall then be checked during the verification of certificates if at least one CRL is available.

Table 8.1: Service Parameters

[SWS_KeyM_00181] ⌈In the following table the input and output parameters of KeyM_ServiceCertificate() API depending on the Service parameter are specified:⌋*(SRS_CryptoStack_00115, SRS_CryptoStack_00125)*

Service parameter	***Request***	***Response***
KEYM_SERVICE_CERT_REQUEST_CSR	_	certificate
KEYM_SERVICE_CERT_UPDATE_SIGNED_CSR	certificate	_
KEYM_SERVICE_CERT_SET_ROOT	root certificate	_
KEYM_SERVICE_CERT_UPDATE_ROOT	root certificate	_
KEYM_SERVICE_CERT_SET_INTERMEDIATE	certificate	_
KEYM_SERVICE_CERT_UPDATE_INTERMEDIATE	certificate	_
KEYM_SERVICE_CERT_UPDATE_CRL	revocation list	_

Note: The KeyM_SetCertificate() function is used to store a given certificate to verify it against a certificate chain. Certificates from the chain can either be provided temporarily in dedicated certificate slots and stored with KeyM_SetCertificate() or are permanently stored with the KeyM_ServiceCertificate{ByCertId}(). This can be done, for example, through proprietary operations during the manufacturing process. At least it is necessary for a proper operation, that the root certificate is available.

[SWS_KeyM_00114] ⌈If KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE, then a key update session shall be started before a service certificate operation can be performed.⌋*(SRS_CryptoStack_00111)*

[SWS_KeyM_00149] ⌈The service operation runs asynchronously and will call KeyM_ServiceCertificateCallbackNotification() with results when the operation has finished.⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101)*

8.3.3.2 KeyM_SetCertificate

[SWS_KeyM_00057] ⌈

Service Name	KeyM_SetCertificate	
Syntax	`Std_ReturnType KeyM_SetCertificate ( KeyM_CertificateIdType CertId, const KeyM_CertDataType* CertificateDataPtr )`	
Service ID [hex]	0x0a	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the certificate
	CertificateDataPtr	Pointer to a structure that provides the certificate data.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Certificate accepted. E_NOT_OK: Certificate could not be set. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	This function provides the certificate data to the key management module to temporarily store the certificate.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00485)* The KeyM_SetCertificate() function is used to store a given certificate to verify it against a certificate chain. Certificates from the chain can either be provided temporarily in dedicated certificate slots and stored with KeyM_SetCertificate() or are permanently stored with the KeyM_ServiceCertificate(). This can be done, for example, through proprietary operations during the manufacturing process. At least it is necessary for a proper operation, that the root certificate is available.

[SWS_KeyM_00115] ⌈If all parameters are accepted the function shall store the provided certificate data in an internal memory that is assigned to the certificate slot referenced by the given CertId, typically in RAM. Once the certificate is provided the certificate submodule will start parsing the certificate.⌋*(SRS_CryptoStack_00111)*

The parsing of a certificate can either be done directly within this function or can be operated in the background or main function.

Note: Setting the certificate and parsing it successfully does not necessarily imply that the certificate is validated in its chain of trust. The parsing is merely a pre-requisite to perform a certificate validation which is requested with another function.

[SWS_KeyM_00116] ⌈The function returns E_OK if the certificate was basically accepted. Any other return value indicates that the certificate was not accepted. No parsing and validation operation can be performed on this certificate until a new certificate is provided and accepted.⌋*(SRS_CryptoStack_00096)*

Info: The status of the certificate if it is parsed or validated successfully can be checked with KeyM_CertGetStatus().

[SWS_KeyM_00166] ⌈If the storage class of the certificate referenced by the container KeyMCertificate//KeyMCertificateStorage is set to KEYM_STORAGE_IN_CSM or KEYM_STORAGE_IN_NVM a development error KEYM_E_CONFIG_FAILURE shall be generated. If development mode is disabled the value E_NOT_OK shall be returned.⌋*(SRS_CryptoStack_00118, SRS_CryptoStack_00096)*

[SWS_KeyM_00141] ⌈The status of a certificate can be reset by calling KeyM_SetCertificate() with the corresponding certificate ID but with length information 0. The function will return E_OK and will reset the status of the certificate to KEYM_CERTIFICATE_NOT_AVAILABLE (see KeyM_CertGetStatus()).⌋*(SRS_CryptoStack_00096, SRS_CryptoStack_00115)*

8.3.3.3 KeyM_GetCertificate

[SWS_KeyM_00058] ⌈

Service Name	KeyM_GetCertificate	
Syntax	`Std_ReturnType KeyM_GetCertificate ( KeyM_CertificateIdType CertId, KeyM_CertDataType* CertificateDataPtr )`	
Service ID [hex]	0x0b	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the certificate
Parameters (inout)	CertificateDataPtr	Provides a pointer to a certificate data structure. The buffer located by the pointer in the structure shall be provided by the caller of this function. The length information indicates the maximum length of the buffer when the function is called. If E_OK is returned, the length information indicates the actual length of the certificate data in the buffer.
Parameters (out)	None	
Return value	Std_ReturnType	E_OK Certificate data available and provided. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Certificate ID invalid. KEYM_E_KEY_CERT_SIZE_MISMATCH: Provided buffer for the certificate too small. KEYM_E_KEY_CERT_EMPTY: No certificate data available, the certificate slot is empty. KEYM_E_KEY_CERT_READ_FAIL: Certificate cannot be provided, access denied.
Description	This function provides the certificate data	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00112, SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484)*

[SWS_KeyM_00117] ⌈This function shall provide certificate data referenced by certificate ID. It retrieves the information from the corresponding slot, checks if the data structure references a data buffer that is large enough to store the requested certificate, copies the data into the elements of CertificateDataPtr and adjusts the size. The func-

tion returns E_OK on success, or any other appropriate return value if the certificate data cannot be provided.⌋(*SRS_CryptoStack_00112*, *SRS_CryptoStack_00096*)

8.3.3.4 KeyM_VerifyCertificates

[SWS_KeyM_00059] ⌈

Service Name	KeyM_VerifyCertificates	

Syntax	`Std_ReturnType KeyM_VerifyCertificates (`
	`  KeyM_CertificateIdType CertId,`
	`  KeyM_CertificateIdType CertUpperId`
	`)`	

Service ID [hex]	0x0c	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the lower certificate in the chain
	CertUpperId	Holds the identifier of the upper certificate in the chain
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Certificate verification request accepted. Operation will be performed in the background and response is given through a callback. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY:Validation cannot be performed yet. KeyM is currently busy with other jobs. KEYM_E_PARAMETER_MISMATCH: Certificate ID invalid. KEYM_E_KEY_CERT_EMPTY: One of the certificate slots are empty. KEYM_E_CERT_INVALID_CHAIN_OF_TRUST: An upper certificate is not valid.
Description	This function verifies two certificates that are stored and parsed internally against each other. The certificate referenced with CertId was signed by the certificate referenced with certUpperId. Only these two certificates are validated against each other.	
Available via	KeyM.h	

⌋(*SRS_CryptoStack_00106*, *SRS_CryptoStack_00101*, *SRS_CryptoStack_00111*, *SRS_BSW_00310*, *SRS_BSW_00357*, *SRS_BSW_00484*)

[SWS_KeyM_00118] ⌈The function shall validate two certificates referenced by certificate IDs. Both certificate data shall be present, the certificate referenced by Cert UpperId shall have been validated before, otherwise the function will return KEYM_E_CERT_INVALID_CHAIN_OF_TRUST.⌋(*SRS_CryptoStack_00111*)

[SWS_KeyM_00119] ⌈The function returns E_OK if the validation request was accepted. Any other return value indicates an error and the validation will not be started. It does not perform the validation operation directly, but in the background. A callback will be called after validation to provide the result.⌋(*SRS_CryptoStack_00106*, *SRS_CryptoStack_00096*)

[SWS_KeyM_00123] ⌈After the certificate submodule has successfully validated the certificate, the corresponding public key shall be stored in the assigned key element of the CSM. This allows the application to operate jobs where this key is assigned to.⌋(*SRS_CryptoStack_00118*)

[SWS_KeyM_00139] ⌈If a certificate shall be verified but has not yet been parsed, the parsing operation shall be done as soon as possible and the verification process shall be started afterwards.⌋*(SRS_CryptoStack_00111, SRS_CryptoStack_00031)*

8.3.3.5 KeyM_VerifyCertificate

[SWS_KeyM_00060] ⌈

Service Name	KeyM_VerifyCertificate	
Syntax	`Std_ReturnType KeyM_VerifyCertificate ( KeyM_CertificateIdType CertId )`	
Service ID [hex]	0x0d	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the certificate
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Certificate verification request accepted. Operation will be performed in the background and response is given through a callback. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs. KEYM_E_PARAMETER_MISMATCH: Certificate ID invalid. KEYM_E_KEY_CERT_EMPTY: One of the certificate slots are empty. KEYM_E_CERT_INVALID_CHAIN_OF_TRUST: An upper certificate is not valid.
Description	This function verifies a certificate that was previously provided with KeyM_SetCertificate() against already stored and provided certificates stored with other certificate IDs.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101, SRS_CryptoStack_00031, SRS_CryptoStack_00111, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484)*
The intention of KeyM_VerifyCertificate() is to autonomously identify the certificates referenced by CertID and the associated certificates in the chain. The certificate that shall be validated is expected to be set prior to this function call with KeyM_SetCertificate(). If a certificate in the chain is not yet verified, it will be parsed and verified automatically until the complete chain of trust has been parsed and verified up to the root certificate. The verification shall be done from the top of the certificate hierarchy to the bottom. Thus, the function shall first identify the chain of trust and check if the root certificate has been validated. If this is valid, the next intermediate certificate shall be checked until the certificate referenced by CertID is to be verified. The order of the validation is important to meet security requirements.

[SWS_KeyM_00120] ⌈The verification of the certificate(s) shall be done asynchronously. All certificates that are involved in the chain of trust shall be verified, from top to bottom. The callback function KeyM_CertificateVerifyCallbackNotification() shall be called if the verification has been finished and provide the result of the operation in the callback.⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101)*

[SWS_KeyM_00121] ⌈The function returns E_OK if the operation has been accepted and can be performed. Any other return value will indicate the appropriate error and the verification will not be started.⌋*(SRS_CryptoStack_00096)*

[SWS_KeyM_00135] ⌈Elements of the certificate associated and defined in KeyMCertificateElement and subcontainers shall be used to verify elements of the certificate according to the configuration. This shall be done for every certificate that has to be verified.⌋*(SRS_CryptoStack_00031, SRS_CryptoStack_00111)*

8.3.3.6 KeyM_VerifyCertificateChain

[SWS_KeyM_00061] ⌈

Service Name	KeyM_VerifyCertificateChain	
Syntax	`Std_ReturnType KeyM_VerifyCertificateChain ( KeyM_CertificateIdType CertId, const KeyM_CertDataType[] certChainData, uint8 NumberOfCertificates )`	
Service ID [hex]	0x0e	
Sync/Async	Asynchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the last certificate in the chain.
	certChainData	This is a pointer to an array of certificates sorted according to the order in the PKI.
	NumberOfCertificates	Defines the number of certificates stored in the CertChainData array.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: Certificate verification request accepted. Operation will be performed in the background and response is given through a callback. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs. KEYM_E_PARAMETER_MISMATCH: Certificate ID invalid. KEYM_E_KEY_CERT_EMPTY: One of the certificate slots are empty. KEYM_E_CERT_INVALID_CHAIN_OF_TRUST: An upper certificate is not valid.
Description	This function performs a certificate verification against a list of certificates. It is a pre-requisite that the certificate that shall be checked has already been written with KeyM_SetCertificate() and that the root certificate is either in the list or is already assigned to one of the other certificates.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101, SRS_BSW_00310, SRS_BSW_00357, SRS_BSW_00484, SRS_BSW_00485)* The function KeyM_VerifyCertificateChain() is called when a certificate shall be validated, but there are one or more other certificates that is required for the chain of trust. For example, a PKI consists of four certificates, including the root certificate and the certificate used for authentication. Two other certificates are not permanently available in the configuration and they are just needed to proof the authentication of the one in place. Thus, only the

to-be-verified certificate need to be set with KeyM_SetCertificate() while the other two certificates of the chain can be provided in a temporary buffer. They are needed to complete the chain of trust. The verification will start by identifying the permanently provided certificate, namely the root certificate in-place. This certificate is checked followed by any other permanently stored certificates until the missing one in the chain. These certificates are referenced by certChainData. The first one from the list will be parsed and verified against the last one that has been permanently stored in the certificate submodule. This would be the root certificate in our example. If the first certificate in certChainData can be verified against the root certificate, the next one in certChain Data will be verified against the previously verified until all certificates in certChainData have been verified. The last one in the list will then be used to verify the certificate referenced with CertId. Only the final result of this verification is important and need to be stored. The intermediate results for the verification of certChainData is not important and can be dropped.

[SWS_KeyM_00124] ⌈The verification of the certificate(s) shall be done asynchronously. All certificates that are involved in the chain of trust shall be verified, from top to bottom. The callback function KeyM_CertificateVerifyCallbackNotification() shall be called if the verification has been finished and provide the result of the operation in the callback.⌋*(SRS_CryptoStack_00106, SRS_CryptoStack_00101)*

[SWS_KeyM_00125] ⌈The function returns E_OK if the operation has been accepted and can be performed. Any other return value will indicate the appropriate error and the verification will not be started.⌋*(SRS_CryptoStack_00096)*

[SWS_KeyM_00126] ⌈After the certificate submodule has successfully validated the certificate, the corresponding public key shall be stored in the assigned key element of the CSM. This allows the application to operate jobs where this key is assigned to.

This has to be done each time a verification of a certificate was successfully performed, regardless of the function call that has been used.⌋*(SRS_CryptoStack_00118)*

8.3.3.7 KeyM_CertElementGet

[SWS_KeyM_00063] ⌈

Service Name	KeyM_CertElementGet	
Syntax	`Std_ReturnType KeyM_CertElementGet ( KeyM_CertificateIdType CertId, KeyM_CertElementIdType CertElementId, uint8* CertElementData, uint32* CertElementDataLength )`	
Service ID [hex]	0x0f	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Holds the identifier of the certificate.

▽

△

	CertElementId	Specifies the ElementId where the data shall be read from.
Parameters (inout)	CertElementDataLength	In: Pointer to a value that contains the maximum data length of the CertElementData buffer. Out: The data length will be overwritten with the actual length of data placed to the buffer if the function returns E_OK. Otherwise, the it will be overwritten with the value zero.
Parameters (out)	CertElementData	Pointer to a data buffer allocated by the caller of this function. If available, the function returns E_OK and copies the data into this buffer.
Return value	Std_ReturnType	E_OK: Element found and data provided in the buffer. E_NOT_OK: Element data not found. KEYM_E_PARAMETER_MISMATCH: Certificate ID or certificate element ID invalid. KEYM_E_KEY_CERT_SIZE_MISMATCH: Provided buffer for the certificate element too small. KEYM_E_KEY_CERT_EMPTY: No certificate data available, the certificate slot is empty. KEYM_E_KEY_CERT_INVALID: The certificate is not valid or has not yet been verified.
Description	Provides the content of a specific certificate element. The certificate configuration defines how the certificate submodule can find the element, e.g. by providing the object identifier (OID). This function is used to retrieve this information if only one element is assigned to the respective OID.	
Available via	KeyM.h	

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*, *SRS_BSW_00484*)

[SWS_KeyM_00127] ⌈The function shall retrieve certificate elements from the certificate as defined in the configuration by searching the object ID in the configured section of the certificate and provide the data from the parsed and validated certificate by copying the content into the provided data buffer when the indicated buffer size is large enough.⌋(*SRS_CryptoStack_00112*)

8.3.3.8 KeyM_CertElementGetByIndex

[SWS_KeyM_91014] ⌈

Service Name	KeyM_CertificateElementGetByIndex	

Syntax	`Std_ReturnType KeyM_CertificateElementGetByIndex (`
	`  KeyM_CertificateIdType CertId,`
	`  KeyM_CertElementIdType CertElementId,`
	`  uint16 Index,`
	`  uint8* CertElementDataPtr,`
	`  uint32* CertElementDataLengthPtr`
	`)`	

Service ID [hex]	0x1b	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Identifier of the certificate where the element shall be read from.
	CertElementId	Specifies the ElementId where the data shall be read from.
	Index	Specifies the index to the element that shall be read (0..N).

▽

△

Parameters (inout)	CertElementDataLength Ptr	In: Pointer to a value that contains the maximum data length of the CertElementData buffer. Out: The data length will be overwritten with the actual length of data placed to the buffer if the function returns E_OK.
Parameters (out)	CertElementDataPtr	Pointer to a data buffer allocated by the caller of this function. If the function returns E_OK element data are copied into this buffer.
Return value	Std_ReturnType	E_OK: Element found and data provided in the buffer. E_NOT_OK: Unable to read the element data. KEYM_E_PARAMETER_MISMATCH: Invalid certificate ID, element ID invalid or index out of range. KEYM_E_KEY_CERT_SIZE_MISMATCH: Provided buffer for the certificate element too small. KEYM_E_KEY_CERT_EMPTY: No certificate data available, the certificate is empty. KEYM_E_CERT_INVALID: Certificate is not valid or not verified successfully
Description	This function provides the element data of a certificate. The function is used if an element type can have more than one parameter. The index specifies which element shall be read. The function works similar to the KeyM_CertElementGetFirst/KeyM_CertElementGetNext, but instead of the iteration, the individual elements can be accessed by index (like the operation in the service interface)	
Available via	KeyM.h	

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*, *SRS_BSW_00484*)

8.3.3.9 KeyM_CertElementGetCount

[SWS_KeyM_91015] ⌈

Service Name	KeyM_CertificateElementGetCount	
Syntax	`Std_ReturnType KeyM_CertificateElementGetCount ( KeyM_CertificateIdType CertId, KeyM_CertElementIdType CertElementId, uint16* CountPtr )`	
Service ID [hex]	0x1c	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CertId	Identifier of the certificate.
	CertElementId	Specifies the certificate element.
Parameters (inout)	None	
Parameters (out)	CountPtr	Pointer to the buffer where the number of available data elements for this certificate element shall be copied to.
Return value	Std_ReturnType	E_OK: Count value has been provided. E_NOT_OK: Unable to provide the count value. KEYM_E_PARAMETER_MISMATCH: Certificate ID or certificate element ID invalid resp. out of range.

▽

△

Description	This function provides the total number of data elements that are available for the specified certificate element. Typically, only one data element is available. But in some cases, several data elements can be assigned to one certificate element in a row. This function retrieves the total number of elements. The individual data elements can then accessed with KeyM_CertificateElementGetByIndex(). It is similar to the functions KeyM_CertElementGetFirst/KeyM_CertElementGetNext to retrieve a group of data elements of one certificate element.
Available via	KeyM.h

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*, *SRS_BSW_00484*)

8.3.3.10 KeyM_CertElementGetFirst

[SWS_KeyM_00064] ⌈

Service Name	KeyM_CertElementGetFirst	

Syntax	`Std_ReturnType KeyM_CertElementGetFirst (`
	`  KeyM_CertificateIdType CertId,`
	`  KeyM_CertElementIdType CertElementId,`
	`  KeyM_CertElementIteratorType* CertElementIterator,`
	`  uint8* CertElementData,`
	`  uint32* CertElementDataLength`
	`)`	

Service ID [hex]	0x10	
Sync/Async	Synchronous	
Reentrancy	Reentrant Reentrant for one iterator.	
Parameters (in)	CertId	Holds the identifier of the certificate.
	CertElementId	Specifies the CertElementId where the data shall be read from.
Parameters (inout)	CertElementIterator	Pointer to a structure that is allocated and maintained by the caller. It shall not be destroyed or altered by the application until all elements have been retrieved through KeyM_CertElementGetNext().
	CertElementDataLength	In: Pointer to a value that contains the maximum data length of the CertElementData buffer. Out: The data length will be overwritten with the actual length of data placed to the buffer if the function returns E_OK.
Parameters (out)	CertElementData	Pointer to a data buffer allocated by the caller of this function. If available, the function returns E_OK and copies the data into this buffer.
Return value	Std_ReturnType	E_OK: Element found and data provided in the buffer. The cert ElementIterator has been initialized accordingly. E_NOT_OK: Element data not found. CertElementIterator cannot be used for further calls. KEYM_E_PARAMETER_MISMATCH: Certificate ID or certificate element ID invalid. KEYM_E_KEY_CERT_SIZE_MISMATCH: Provided buffer for the certificate element too small. KEYM_E_KEY_CERT_EMPTY: No certificate data available, the certificate is empty. KEYM_E_CERT_INVALID: Certificate is not valid or not verified successfully

▽

△

Description	This function is used to initialize the interative extraction of a certificate data element. It always retrieves the top element from the configured certificate element and initializes the structure KeyM_CertElementIterator so that consecutive data from this element can be read with KeyM_CertElementGetNext().
Available via	KeyM.h

⌋*(SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00312, SRS_BSW_00357, SRS_BSW_00484)*

[SWS_KeyM_00128] ⌈The function shall retrieve certificate elements from the certificate as defined in the configuration by searching the object ID in the configured section of the certificate. If no error is detected, the identified data from the parsed and validated shall be provided from the certificate by copying the content into the provided data buffer when the indicated buffer size is large enough and the function shall return E_OK. Otherwise, any other appropriate error code shall be provided.⌋*(SRS_CryptoStack_00096, SRS_CryptoStack_00112)*

[SWS_KeyM_00129] ⌈The function returns E_OK, the iterator structure shall be initialized in a way, that further listed elements associated to the referenced certificate element can be retrieved one after another.⌋*(SRS_CryptoStack_00112)*

Rationale:

Some certificate elements can contain more than one element associated to an object ID. The function pair of KeyM_CertElementGetFirst()/ KeyM_CertElementGetNext() shall be used to retrieve a list of elements one after another. The iterator, which is implementation specific, shall be used to forward iterate through the list of elements.

8.3.3.11 KeyM_CertElementGetNext

[SWS_KeyM_00065] ⌈

Service Name	KeyM_CertElementGetNext	
Syntax	`Std_ReturnType KeyM_CertElementGetNext ( KeyM_CertElementIteratorType* CertElementIterator, uint8* CertElementData, uint32* CertElementDataLength )`	
Service ID [hex]	0x11	
Sync/Async	Synchronous	
Reentrancy	Reentrant Reentrant for one iterator.	
Parameters (in)	None	
Parameters (inout)	CertElementIterator	Pointer to a structure that is allocated by the caller and used by the function. It shall not be destroyed or altered by the application until all elements have been read from the list.
	CertElementDataLength	In: Pointer to a value that contains the maximum data length of the CertElementData buffer. Out: The data length will be overwritten with the actual length of data placed to the buffer if the function returns E_OK.

▽

△

Parameters (out)	CertElementData	Pointer to a data buffer allocated by the caller of this function. If available, the function returns E_OK and copies the data into this buffer.
Return value	Std_ReturnType	E_OK: Element found and data provided in the buffer. The Cert ElementIterator has been initialized accordingly. E_NOT_OK: Element data not found. CertElementIterator cannot be used for further calls. KEYM_E_PARAMETER_MISMATCH: Certificate ID or certificate element ID invalid. KEYM_E_KEY_CERT_SIZE_MISMATCH: Provided buffer for the certificate element too small. KEYM_E_KEY_CERT_EMPTY: No certificate data available, the certificate is empty. KEYM_E_CERT_INVALID: Certificate is not valid or not verified successfully
Description	This function provides further data from a certificate element, e.g. if a set of data are located in one certificate element that shall be read one after another. This function can only be called if the function KeyM_CertElementGetFirst() has been called once before.	
Available via	KeyM.h	

⌋*(SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00312, SRS_BSW_-00357)*

[SWS_KeyM_00148] ⌈This function can only be called for certificate elements where KeyMCertificateElementHasIteration is set to TRUE. Otherwise, the function shall return KEYM_E_CERT_INVALID.⌋*(SRS_CryptoStack_00112)*

[SWS_KeyM_00130] ⌈The function KeyM_CertGetElementFirst() shall be called once with return value E_OK before the KeyM_CertGetElementNext() can be called.⌋*(SRS_-CryptoStack_00112)*

[SWS_KeyM_00131] ⌈If KeyM_CertGetElementNext() returns any other value than E_OK, no further function call to KeyM_CertElementGetNext() is allowed with the iterator structure until a new a successful call to KeyM_CertElementGetFirst() was performed.⌋*(SRS_CryptoStack_00112)*

[SWS_KeyM_00132] ⌈The function KeyM_CertGetElementNext() returns E_OK and provides further data from the list referenced by certificate and certificate element ID used by the call to KeyM_CertGetElementFirst().⌋*(SRS_CryptoStack_00096, SRS_-CryptoStack_00112)*

[SWS_KeyM_00136] ⌈A certificate is in the status KEYM_CERTIFICATE_INVALID if the contents could not be parsed due to an internal error, e.g. a format error, signature failure period failure or any other failure occurred during the verification.⌋*(SRS_CryptoStack_00115, SRS_CryptoStack_00023)*

[SWS_KeyM_00137] ⌈A certificate has the status KEYM_CERTIFICATE_PARSED_NOT_VALIDATED if the certificate has been provided e.g. with the function KeyM_Set Certificate() and has been parsed successfully, but the verification has not yet been initiated, e.g. by a call to KeyM_VerifyCertificate().⌋*(SRS_CryptoStack_00115)*

)

[SWS_KeyM_00138] ⌈A certificate has the status KEYM_CERTIFICATE_NOT_PARSED if the certificate was already provided, e.g. with KeyM_SetCertificate() but the parsing process is still ongoing in the background.⌋*(SRS_CryptoStack_00115)*

)

[SWS_KeyM_00140] ⌈A certificate is in the status KEYM_CERTIFICATE_NOT_AVAILABLE if the certificate has not yet been provided by a function call KeyM_Set Certificate() or the function was called with the certificate ID but with certificate length of 0.⌋*(SRS_CryptoStack_00115)*

)

8.4 Callback notifications

This is a list of functions provided for other modules.

8.5 Call-out definitions

The KeyM module provides no callouts.

8.6 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.6.1 KeyM_MainFunction

[SWS_KeyM_00074] ⌈

Service Name	KeyM_MainFunction

Syntax	`void KeyM_MainFunction (`
	`  void`
	`)`

Service ID [hex]	0x19
Description	Function is called periodically according the specified time interval.
Available via	SchM_KeyM.h

⌋(*SRS_CryptoStack_00106*, *SRS_BSW_00172*, *SRS_BSW_00310*, *SRS_BSW_00478*)

8.6.2 KeyM_MainBackgroudFunction

[SWS_KeyM_00075] ⌈

Service Name	KeyM_MainBackgroundFunction

Syntax	`void KeyM_MainBackgroundFunction (`
	`  void`
	`)`

Service ID [hex]	0x1a
Description	Function is called from a pre-emptive operating system when no other task operation is needed. Can be used for calling time consuming synchronous functions such as KeyM_KH_Update().
Available via	SchM_KeyM.h

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00172*, *SRS_BSW_00310*)

8.7 Expected interfaces

In this chapter all interfaces required from other modules are listed.

8.7.1 Mandatory interfaces

Note: This section defines all interfaces, which are required to fulfill the core functionality of the module.

[SWS_KeyM_00076] ⌈

API Function	*Header File*	*Description*
Csm_KeyElementGet	Csm.h	Retrieves the key element bytes from a specific key element of the key identified by the keyId and stores the key element in the memory location pointed by the key pointer.
Csm_KeyElementSet	Csm.h	Sets the given key element bytes to the key identified by keyId.
Csm_KeySetValid	Csm.h	Sets the key state of the key identified by keyId to valid.

⌋(*SRS_CryptoStack_00118*)

8.7.2 Optional interfaces

This section defines all interfaces, which are required to fulfill an optional functionality of the module.

[SWS_KeyM_00078] ⌈

API Function	*Header File*	*Description*
Csm_KeyDerive	Csm.h	Derives a new key by using the key elements in the given key identified by the keyId. The given key contains the key elements for the password and salt. The derived key is stored in the key element with the id 1 of the key identified by targetCryptoKeyId.
Csm_SignatureVerify	Csm.h	Verifies the given MAC by comparing if the signature is generated with the given data.
Det_ReportError	Det.h	Service to report development errors.
IdsM_SetSecurityEvent	IdsM.h	This API is the application interface to report security events to the IdsM.
IdsM_SetSecurityEventWithContextData	IdsM.h	This API is the application interface to report security events with context data to the IdsM.
StbM_GetCurrentTime	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in standard format. Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).

⌋(*SRS_CryptoStack_00118*, *SRS_CryptoStack_00087*, *SRS_CryptoStack_00122*, *SRS_BSW_00369*, *SRS_BSW_00386*)

8.7.3 Configurable interfaces

In this section, all interfaces are listed where the target function could be configured. The target function is usually a callback function. The names of this kind of interfaces are not fixed because they are configurable.

Hint:

The functional behaviour of key handler functions is described in the respective section of the calling Key Management function.

8.7.3.1 KeyM_KH_Start

[SWS_KeyM_00067] ⌈

Service Name	KeyM_KH_Start	
Syntax	`Std_ReturnType KeyM_KH_Start ( KeyM_StartType StartType, const uint8* RequestData, uint16 RequestDataLength, uint8* ResponseData, uint16* ResponseDataLength )`	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	StartType	Defines in which mode the key operation shall be executed.
	RequestData	Information that comes along with the request, e.g. signature
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData if function returns E_OK.
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Start operation successfully performed. Key update operations are now allowed. E_NOT_OK: Start operation not accepted. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	If KeyMCryptoKeyStartFinalizeFunctionEnabled and KeyMCryptoKeyHandlerStartFinalize Enabled is set to TRUE, this function will be called immediately when KeyM_Start gets called. The function shall return E_OK to switch the Key Manager into the active state for any key operation.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*)

8.7.3.2 KeyM_KH_Prepare

[SWS_KeyM_00068] ⌈

Service Name	KeyM_KH_Prepare	
Syntax	`Std_ReturnType KeyM_KH_Prepare ( const uint8* RequestData, uint16 RequestDataLength, uint8* ResponseDataPtr, uint16* ResponseDataLength )`	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData.
Parameters (out)	ResponseDataPtr	Data returned by the function.
Return value	Std_ReturnType	E_OK: Service has been accepted and will be processed internally. Results will be provided through a callback E_NOT_OK: Service not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	If the configuration parameters KeyMCryptoKeyPrepareFunctionEnabled and KeyMCryptoKeyHandlerPrepareEnabled are both set to TRUE, then this function will be called immediately when KeyM_Prepare gets called. The function takes over the task to prepare a key management operation. The response data will be passed on as is to the caller of Key_Prepare.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00115*, *SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*)

8.7.3.3 KeyM_KH_Update

[SWS_KeyM_00069] ⌈

Service Name	KeyM_KH_Update	
Syntax	`Std_ReturnType KeyM_KH_Update ( const uint8* KeyNamePtr, uint16 KeyNameLength, const uint8* RequestData, uint16 RequestDataLength, uint8* ResultDataPtr, uint16* ResultDataLengthPtr, KeyM_CryptoKeyIdType* KeymId, KeyM_KH_UpdateOperationType* UpdateOperation )`	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	KeyNamePtr	Points to an array that defines the name of the key to be updated

▽

△

	KeyNameLength	Specifies the number of bytes in KeyNamePtr. The value 0 indicates that no KeyNamePtr is provided within this function.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResultDataLengthPtr	In: Max number of bytes available in ResultDataPtr Out: Actual number of bytes in ResultData or 0 if no data available. Unspecified or untouched if return value indicates a failure.
	KeymId	Provides a reference to the crypto key as an index to the crypto key table. In: Providing the key ID if a name was provided and a key was found. Returns 0xFFFFFFFFul if no key was found. Out: Key ID of the key where the operation shall be performed to if updateOperation indicates a key operation.
Parameters (out)	ResultDataPtr	Data returned by the function.
	UpdateOperation	Provides information to the caller what operation has been performed and how to interpret the ResultData.
Return value	Std_ReturnType	E_OK: Data returned by this function. E_NOT_OK: General error, no data provided. E_BUSY: Service could not be accepted because another operation is already ongoing. Try next time. KEYM_E_PARAMETER_MISMATCH: A parameter does not have expected value. Service discarded. KEYM_E_KEY_CERT_WRITE_FAIL: Key could not be written. KEYM_E_KEY_CERT_UPDATE_FAIL: General failure on updating a key.
Description	If the configuration item KeyMCryptoKeyHandlerUpdateEnabled is set to TRUE, the KeyM_Update function will not perform any operation but will delegate the operation to the key handler. On return, the function provides the status of the key operation.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100, SRS_BSW_00310, SRS_BSW_00357*)

[SWS_KeyM_00097] ⌈If a key handler is used for key update operation (KeyMCrypto KeyHandlerUpdateEnabled is set to TRUE), the Key Manager shall provide a pointer to an internal buffer to the key handler when calling KeyM_KH_Update(). This buffer can be used by the key handler to store the key data results during the operation. As a consequence, the KeyM_Update() function shall not touch this buffer after calling Key M_KH_Update() until the key handler returns. The length of the buffer shall be at least as large as the largest value of all KeyMCryptoKey/KeyMCryptoKeyMaxLength defined in the KeyMCryptoKey container.⌋(*SRS_CryptoStack_00107*)

[SWS_KeyM_00096] ⌈If the key handler returns E_OK and provides the operation type KEYM_KH_UPDATE_KEY_UPDATE_REPEAT and ResultDataLengthPtr indicates a value greater than 0 then the key manager shall perform the key update operation according to the configuration (store or derive the key in CSM) and use the data stored in ResultDataPtr.

If the update operation was successful, the key handler shall be called again.⌋(*SRS_CryptoStack_00107, SRS_CryptoStack_00109*)

Info: The repeated call to the key handler update operation allows the key handler to update several keys at a time.

[SWS_KeyM_00093] ⌈If the key handler returns and provides the operation type KEYM_KH_UPDATE_FINISH, the key update operation shall finish and use the re-

turn value from the key handler.The data buffer from KeyM_KH_Update::ResultDataPtr shall be copied to the buffer provided with KeyM_Update::ResultDataPtr and the KeyM_CryptoKeyUpdateCallbackNotification() function shall be called by the job of the KeyM_Update() function.⌋(*SRS_CryptoStack_00107*)

Info:

This allows the key handler update operation to provide results back to the key server.

8.7.3.4 KeyM_KH_Finalize

[SWS_KeyM_00070] ⌈

Service Name	KeyM_KH_Finalize	

Syntax	`Std_ReturnType KeyM_KH_Finalize (`
	`  const uint8* RequestData,`
	`  uint16 RequestDataLength,`
	`  uint8* ResponseData,`
	`  uint16* ResponseDataLength`
	`)`	

Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData.
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Operation has been accepted and will be processed internally. Results will be provided through a callback E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	If KeyMCryptoKeyStartFinalizeFunctionEnabled and KeyMCryptoKeyHandlerStartFinalize Enabled is set to TRUE, this function will be called immediately when KeyM_Finalize gets called KeyM_Finalize() will not perform any operation but will call this key handler function to delegate the operation.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*)

8.7.3.5 KeyM_KH_Verify

[SWS_KeyM_00071] ⌈

Service Name	KeyM_KH_Verify	
Syntax	`Std_ReturnType KeyM_KH_Verify ( const uint8* KeyNamePtr, uint16 KeyNameLength, const uint8* RequestData, uint16 RequestDataLength, uint8* ResponseData, uint16* ResponseDataLength )`	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	KeyNamePtr	Pointer to an array that defines the name of the key to be updated
	KeyNameLength	Specifies the number of bytes in keyName. The value 0 indicates that no keyName is provided within this function.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData.
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	KEYM_E_PENDING: Operation runs in asynchronous mode, has been accepted and will be processed internally. Results will be provided through callback E_OK: Operation was successfully performed. Result information are available. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_BUSY: Validation cannot be performed yet. KeyM is currently busy with other jobs (for asynchronous mode). KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match KEYM_E_KEY_CERT_INVALID: Key operation cannot be performed because the key name is invalid. KEYM_E_KEY_CERT_EMPTY: The key for this slot has not been set.
Description	If KeyMCryptoKeyHandlerVerifyEnabled is set to TRUE, the KeyM_Verify function will not perform any operation but will delegate its operation to this service callback. The intention is to perform a verification of input data using the CSM job referenced with KeyMCryptoKeyCsm VerifyJobRef.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00114*, *SRS_CryptoStack_00117*, *SRS_CryptoStack_00100*, *SRS_BSW_00310*, *SRS_BSW_00357*)

8.7.3.6 KeyM_KH_ServiceCertificate

[SWS_KeyM_00072] ⌈

Service Name	KeyM_KH_ServiceCertificate	
Syntax	`Std_ReturnType KeyM_KH_ServiceCertificate ( KeyM_ServiceCertificateType Service, const uint8* CertName, uint16 CertNameLength, const uint8* RequestData, uint16 RequestDataLength, uint8* ResponseData, uint16* ResponseDataLength )`	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Service	Provides the type of service the certificate submodule has to perform.
	CertName	Points to an array that defines the name of the key to be updated
	CertNameLength	Specifies the number of bytes in keyName. The value 0 indicates that no keyName is provided within this function.
	RequestData	Information that comes along with the request
	RequestDataLength	Length of data in the RequestData array
Parameters (inout)	ResponseDataLength	In: Max number of bytes available in ResponseData Out: Actual number of bytes in ResponseData.
Parameters (out)	ResponseData	Data returned by the function.
Return value	Std_ReturnType	E_OK: Service data operation successfully accepted. E_NOT_OK: Operation not accepted due to an internal error. KEYM_E_PARAMETER_MISMATCH: Parameter do not match with expected value. KEYM_E_KEY_CERT_SIZE_MISMATCH: Parameter size doesn't match
Description	If KeyMCryptoKeyHandlerServiceCertificateEnabled is set to TRUE, this function will be called by KeyM_ServiceCertificate() to delegate the operation to this user specific service function.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_BSW_00310*)

8.7.3.7 KeyM_CryptoKeyUpdateCallbackNotification

[SWS_KeyM_00077] ⌈

Service Name	KeyM_CryptoKeyUpdateCallbackNotification	
Syntax	`void KeyM_CryptoKeyUpdateCallbackNotification ( KeyM_ResultType Result, uint16 ResultDataLength, const uint8* ResultDataPtr )`	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Result	Contains information about the result of the operation.
	ResultDataLength	Contains the length of the resulting data of this operation if any.

▽

△

	ResultDataPtr	Pointer to the data of the result.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Notifies the application that a crypto key update operation has been finished. This function is used by the key manager.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_CryptoStack_00106*, *SRS_BSW_00310*, *SRS_BSW_00312*)

[SWS_KeyM_00150] ⌈This callback function indicates the end of a key update operation. It is called after a successful call to KeyM_Update() that has returned E_OK and the requested key update operation was finished. It is only needed if KeyMCryptoKey ManagerEnabled is set to TRUE.⌋(*SRS_CryptoStack_00106*)

8.7.3.8 KeyM_CryptoKeyFinalizeCallbackNotification

[SWS_KeyM_00079] ⌈

Service Name	KeyM_CryptoKeyFinalizeCallbackNotification	
Syntax	`void KeyM_CryptoKeyFinalizeCallbackNotification ( KeyM_ResultType Result, uint16 ResultDataLength, const uint8* ResultDataPtr )`	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Result	Contains information about the result of the operation.
	ResultDataLength	ontains the length of the resulting data of this operation.
	ResultDataPtr	Pointer to the data of the result (the data buffer that has been provided with the service function).
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Notifies the application that a crypto key finalize operation has been finished. The callback function is only called and needed if KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_CryptoStack_00106*, *SRS_BSW_00310*, *SRS_BSW_00312*)

[SWS_KeyM_00080] ⌈If KeyMCryptoKeyStartFinalizeFunctionEnabled is set to TRUE the callback function KeyM_CryptoKeyFinalizeCallbackNotification() indicates that the finalize operation has been concluded. The result value provides the status of the finalization operation, if all keys have been validated successfully or not. The Result Data can provide additional information about the finalization operation used to provide this back to the key server.⌋(*SRS_CryptoStack_00106*)

8.7.3.9 KeyM_CryptoKeyVerifyCallbackNotification

[SWS_KeyM_00081] ⌈

Service Name	KeyM_CryptoKeyVerifyCallbackNotification	
Syntax	`void KeyM_CryptoKeyVerifyCallbackNotification ( KeyM_ResultType Result, uint32 KeyId, uint16 ResultDataLength, const uint8* ResultDataPtr )`	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Result	Contains information about the result of the operation.
	KeyId	The key identifier where this verification was started for.
	ResultDataLength	Contains the length of the resulting data of this operation if any.
	ResultDataPtr	Pointer to the data of the result.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Notifies the application that a crypto key verify operation has been finished. This function is used by the key manager.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_CryptoStack_00106*, *SRS_BSW_00310*, *SRS_BSW_00312*)

Service Name	KeyM_CertificateVerifyCallbackNotification	
Syntax	`Std_ReturnType KeyM_CertificateVerifyCallbackNotification ( KeyM_CertificateIdType CertId, KeyM_CertificateStatusType Result )`	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	CertId	The certificate identifier that has been verified.
	Result	Contains information about the result of the operation.
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	E_OK
Description	Notifies the application that a certificate verification has been finished. The function name is configurable by KeyMCertificateVerifyCallbackNotificationFunc.	
Available via	KeyM_Externals.h	

⌋(*SRS_CryptoStack_00100*, *SRS_CryptoStack_00106*, *SRS_BSW_00310*, *SRS_BSW_00312*)

[SWS_KeyM_00153] ⌈If a certificate verification request was successfully submitted by KeyM_VerifyCertificate(), KeyM_VerifyCertificates() or KeyM_VerifyCertificateChain() by returning E_OK and KeyMCertificateVerifyCallbackNotificationFunc is configured with a valid function name, this function will get called for the corresponding certificate to indicate the result of the verification operation.⌋(*SRS_CryptoStack_00106*)

8.8 Service Interfaces

This chapter is an add-on to the specification of the KeyM module. Whereas the other parts of the specification define the behavior and the C-interfaces of the corresponding basic software module, this chapter formally describes the corresponding AUTOSAR services for SWC generated by the RTE. The interfaces described here will be visible on the VFB and are used to generate the RTE between application and the KEYM module.

8.8.1 Scope of this Chapter

This chapter defines blueprints of the AUTOSAR Interfaces of the Key Manager Service (KeyM).

According to TPS_GST_00081 these blueprints are placed in ARPackage /AUTOSAR/KeyM.

8.8.2 Data Types

8.8.2.1 KeyM_StartType

[SWS_KeyM_00038] ⌈

Name	KeyM_StartType		
Kind	Enumeration		
Range	KEYM_START_OEM_PRODUCTIONMODE	0x01	Key operation starts in OEM production mode
	KEYM_START_WORKSHOPMODE	0x02	Key operation starts in workshop mode
	reserved	0x80-0x9F	The range from 0x80-0x9F is reserved for user specific extensions
Description	This type specifies in which mode the key operation will start. The OEM production mode provides higher privileges compared to workshop mode.		
Variation	–		
Available via	Rte_KeyM_Type.h		

⌋(*SRS_CryptoStack_00115*)

	Comment	Certificate
	Variation	KeyMCertificate = {ecuc(KeyM/KeyMCertificate.SHORT-NAME)}
Possible Errors	E_OK E_NOT_OK KEYM_E_KEY_CERT_SIZE_MISMATCH KEYM_E_PARAMETER_MISMATCH KEYM_E_KEY_CERT_READ_FAIL KEYM_E_KEY_CERT_EMPTY	

Operation	GetStatus	
Comment	Provides the status of a certificate.	
Mapped to API	KeyM_CertGetStatus	
Variation	–	
Parameters	Status	
	Type	KeyM_CertificateStatusType
	Direction	OUT
	Comment	Provides the status type.
	Variation	–
Possible Errors	E_OK E_NOT_OK	

Operation	SetCertificate	
Comment	Provides certificate data to be processed by the certificate sub module	
Mapped to API	KeyM_SetCertificate	
Variation	–	
Parameters	Certificate	
	Type	KeyM_CertDataType
	Direction	IN
	Comment	Certificate data
	Variation	KeyMCertificate = {ecuc(KeyM/KeyMCertificate.SHORT-NAME)}
Possible Errors	E_OK E_NOT_OK KEYM_E_KEY_CERT_SIZE_MISMATCH KEYM_E_PARAMETER_MISMATCH KEYM_E_KEY_CERT_WRITE_FAIL	

Operation	VerifyCertificate
Comment	Verify certificate data from the certificate sub module
Mapped to API	KeyM_VerifyCertificate
Variation	–
Possible Errors	E_OK E_NOT_OK KEYM_E_BUSY KEYM_E_KEY_CERT_SIZE_MISMATCH KEYM_E_PARAMETER_MISMATCH KEYM_E_KEY_CERT_EMPTY KEYM_E_CERT_INVALID_CHAIN_OF_TRUST

⌋(*SRS_CryptoStack_00096*)

8.8.3.2 KeyMCertificateElement

[SWS_KeyM_00083] ⌈

Name	KeyMCertificateElement_{KeyMCertificate}_{KeyMCertificateElement}		
Comment	Service of the certificate sub module to access certificate elements.		
IsService	true		
Variation	KeyMCertificate = {ecuc(KeyM/KeyMCertificate.SHORT-NAME)} KeyMCertificateElement ={ecuc(KeyM/KeyMCertificate/KeyMCertificateElement.SHORT-NAME)}		
Possible Errors	0	E_OK	–
	1	E_NOT_OK	–
	4	KEYM_E_KEY_CERT_SIZE_MISMATCH	–
	5	KEYM_E_PARAMETER_MISMATCH	–
	6	KEYM_E_CERT_INVALID	–
	10	KEYM_E_KEY_CERT_EMPTY	–

Operation	CertificateElementGet	
Comment	Provides the content of a specific certificate element. The certificate configuration defines how the certificate submodule can find the element, e.g. by providing the object identifier (OID). This function is used to retrieve this information if only one element is assigned to the respective OID.	
Mapped to API	KeyM_CertElementGet	
Variation	–	
Parameters	CertificateElementData	
	Type	KeyM_CertificateElementType_{KeyMCertificate}_{KeyMCertificateElement}
	Direction	OUT
	Comment	–
	Variation	KeyMCertificate ={ecuc(KeyM/KeyMCertificate.SHORT-NAME)}, KeyMCertificateElement ={ecuc(KeyM/KeyMCertificate/KeyMCertificateElement.SHORT-NAME)}
	CertificateDataLength	
	Type	uint32
	Direction	OUT
	Comment	–
	Variation	–
Possible Errors	E_OK E_NOT_OK KEYM_E_KEY_CERT_SIZE_MISMATCH KEYM_E_PARAMETER_MISMATCH KEYM_E_CERT_INVALID KEYM_E_KEY_CERT_EMPTY	

Operation	CertificateElementGetByIndex	
Comment	This operation provides the data of a certificate element. The function is used when an element may contain more than one element. The index allows to access the n(th) value of an element. This can be considered like an "array" access. Index=0 accesses the first element.	
Mapped to API	–	
Variation	–	
Parameters	Index	
	Type	uint16
	Direction	IN
	Comment	This is the index to dedicated element in the list
	Variation	–
	CertificateElementData	
	Type	KeyM_CertificateElementType_{KeyMCertificate}_{KeyMCertificateElement}
	Direction	OUT
	Comment	–
	Variation	KeyMCertificate = {ecuc(KeyM/KeyMCertificate.SHORT-NAME)}, KeyMCertificateElement ={ecuc(KeyM/KeyMCertificate/KeyMCertificateElement.SHORT-NAME)}
	CertificateDataLength	
	Type	uint32
	Direction	OUT
	Comment	–
	Variation	–

9 Sequence diagrams

9.1 Store single key

Configuration item KeyMCryptoKeyStartFinalizeFunctionEnabled assumed to be FALSE, KeyM_Prepare() is activated and delegated to the key handler.

KeyM_Update() operation completely covered by KeyM.

Store single key sequence (KeyMCryptoKeyGenerationType==KEYM_STORED_KEY)

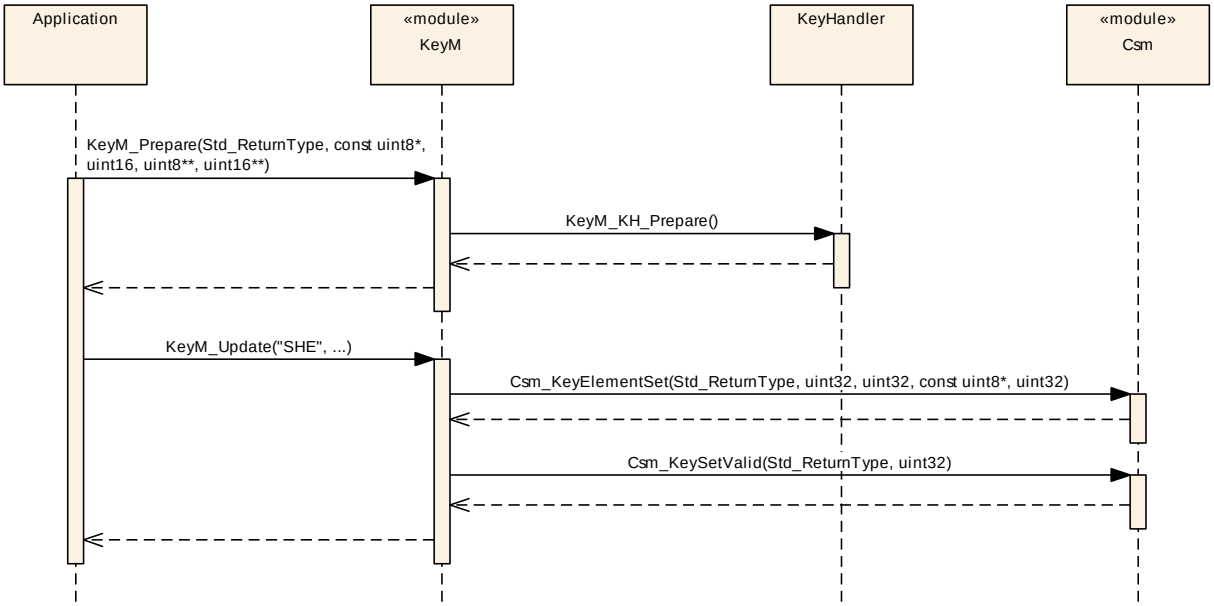

Figure 9.1: Store single key

9.2 Store multiple keys

Example with StartFinalize enabled and managed by KeyM (no delegation via Key M_KH_Start() to key handler). The KeyM_Prepare() operation is delegated to the key handler. Multiple keys are set or updated using multiple KeyM_Update() calls. The keys are updated using the Csm_KeyElementSet() function according to the configuration of the keys.

During finalization the KeyM sets all keys to valid.

Store multiple keys sequence (KeyMCryptoKeyGenerationType==KEYM_STORED_ KEY)

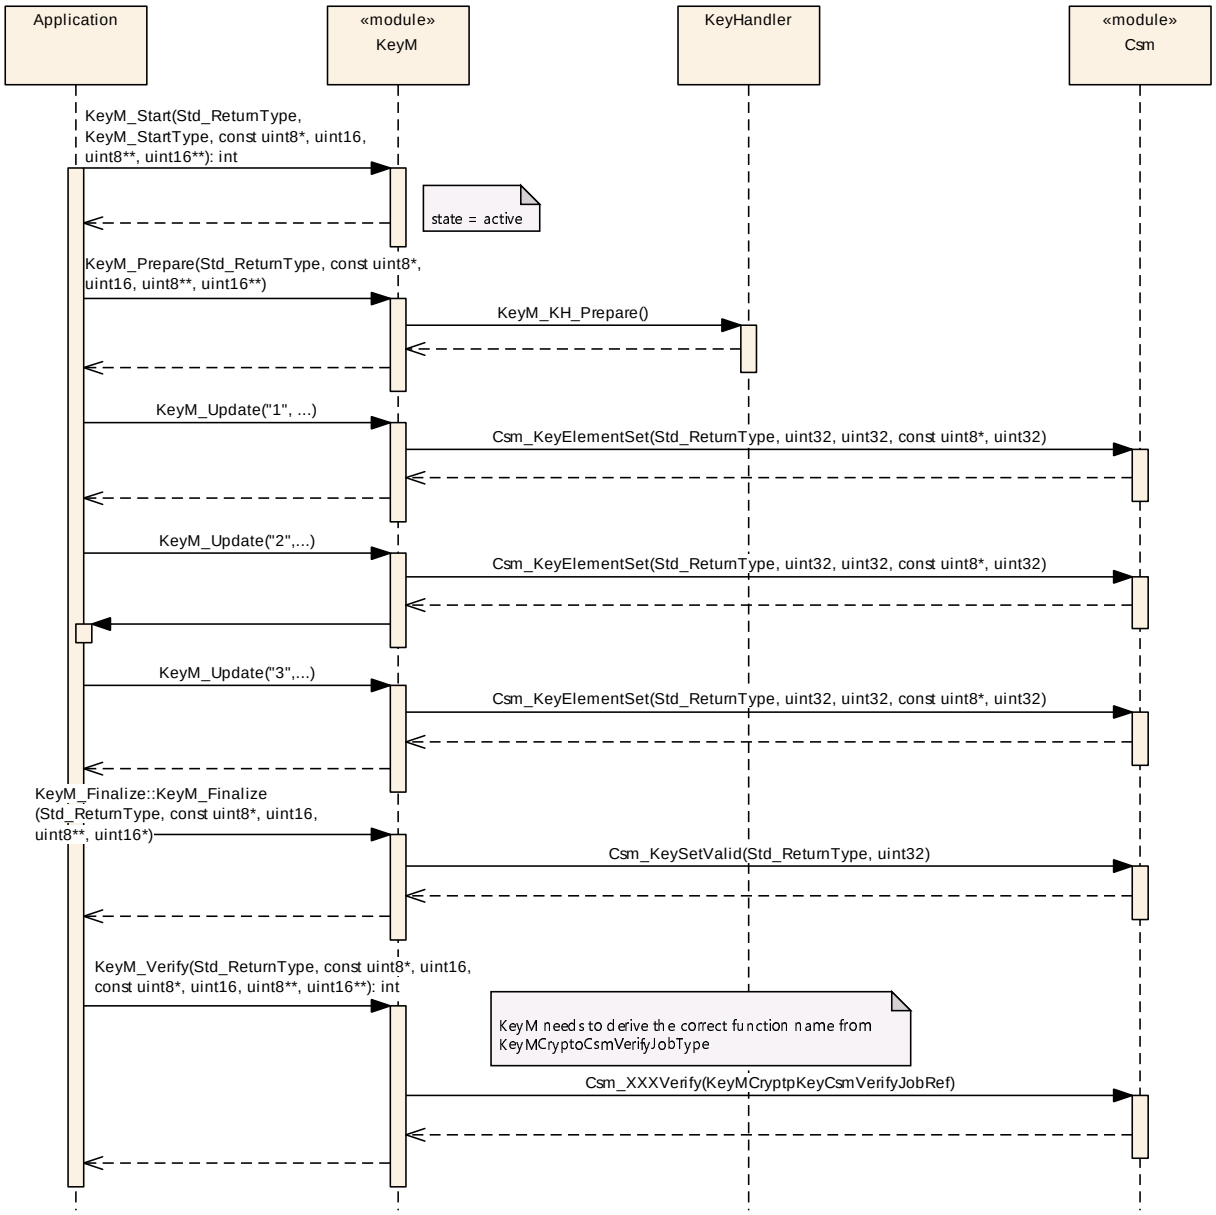

Figure 9.2: Store multiple key

9.3 Derive key

Example using Csm_KeyDerive sequence instead of Csm_KeyElementSet() (KeyMCryptoKeyGenerationType==KEYM_DERIVED_KEY).

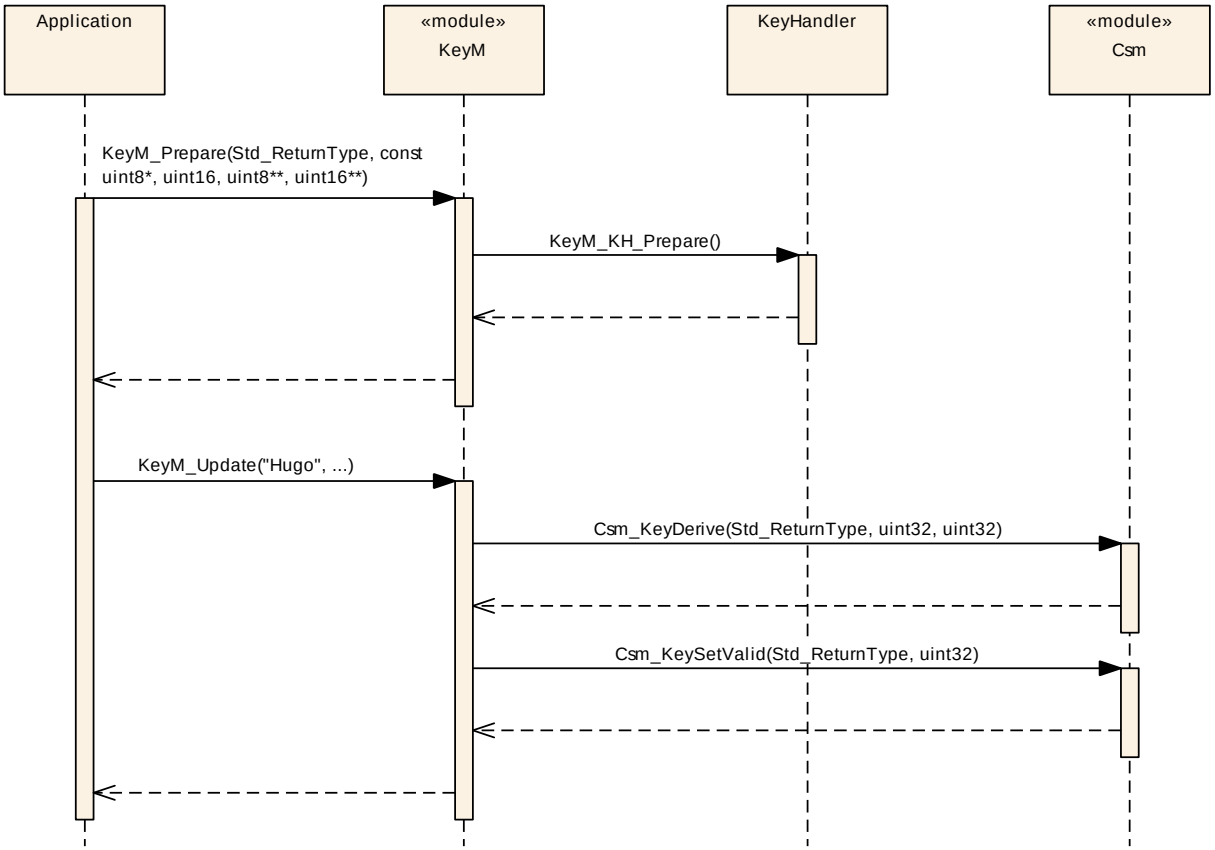

Figure 9.3: Derive key

9.4 Add working certificate

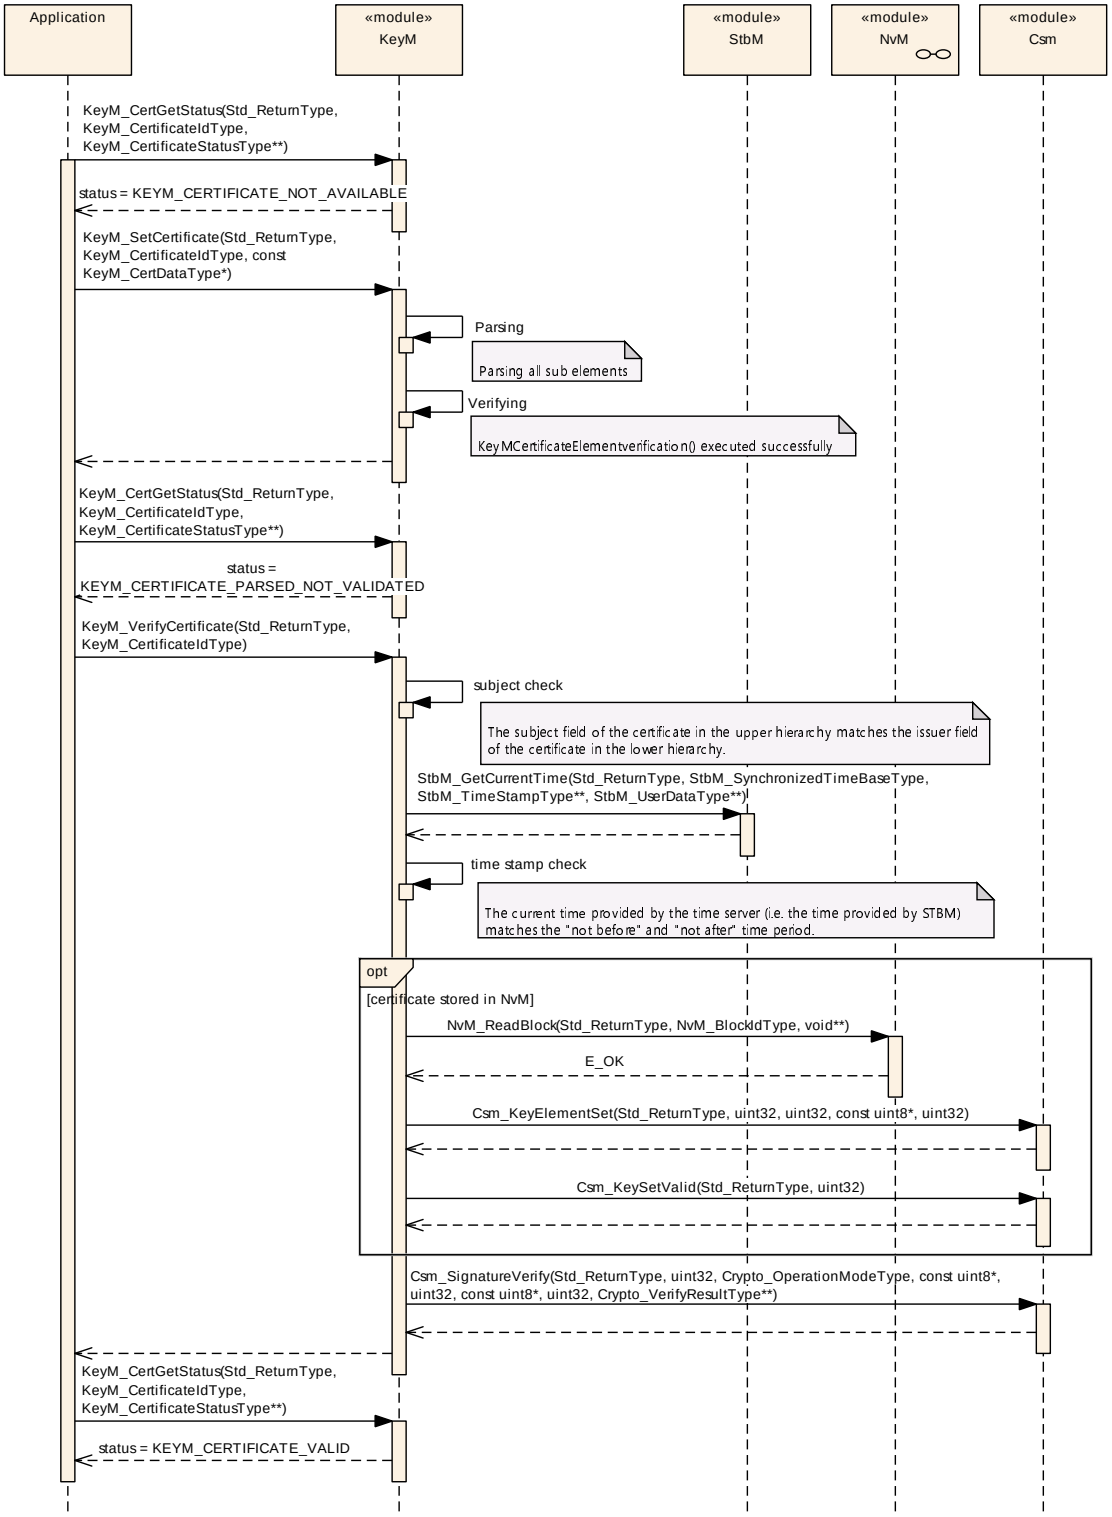

Figure 9.4: Add Working Certificate

9.5 Add root or intermediate certificate

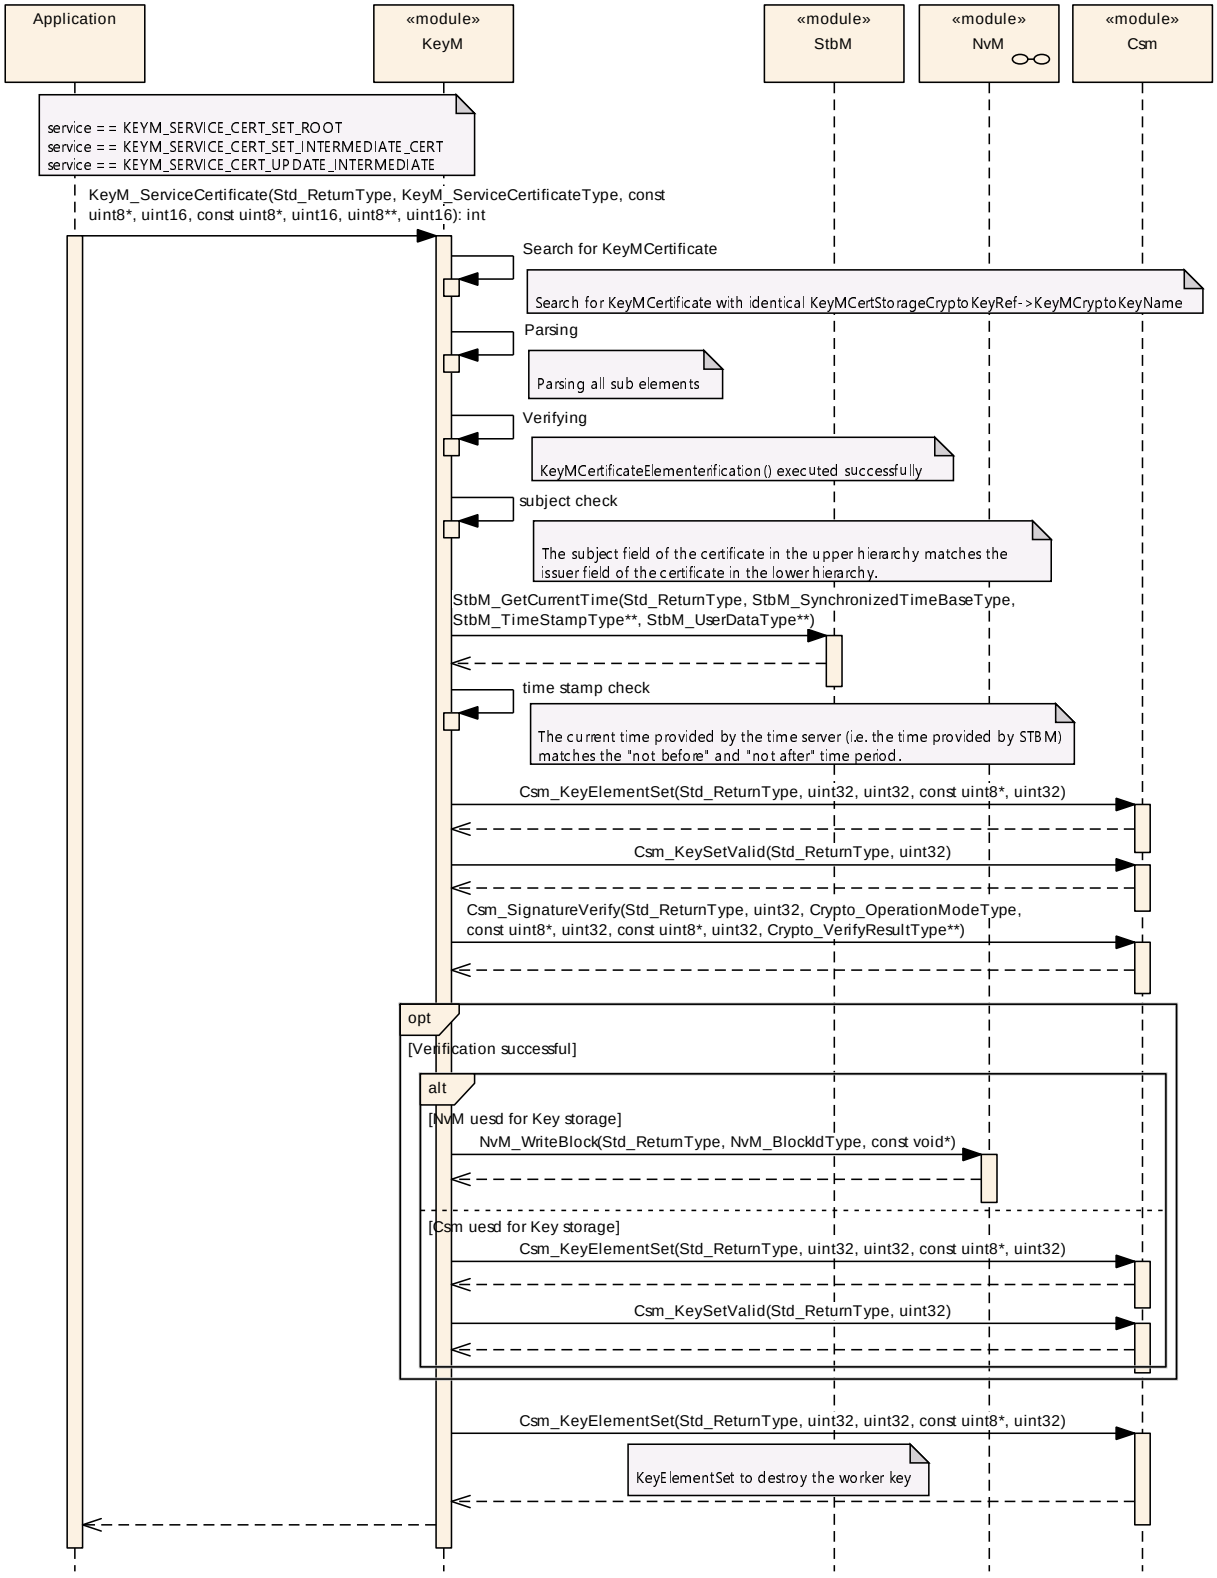

Figure 9.5: Add Root or intermediate Certificate

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module KeyM.

Chapter 10.3 specifies published information of the module KeyM.

10.1 How to read this chapter

For details refer to the chapter 10.1 “Introduction to configuration specification” in SWS_BSWGeneral.

10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapter 7 and Chapter 8.

10.2.1 KeyM

SWS Item	[ECUC_KeyM_00001]
Module Name	KeyM
Description	Configuration of the Mcu (Microcontroller Unit) module.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
KeyMCertificate	0..65535	This container contains the certificate configuration.
KeyMCertificateElementVerification	0..65535	This container defines if and how certificate elements are to be verified.
KeyMCryptoKey	0..65535	This container contains the crypto keys that can be updated.
KeyMGeneral	1	This container holds general configuration (parameters) for key manager.
KeyMNvmBlock	0..65535	Configuration of optional usage of Nvm in case the KeyM module requires non volatile memory in the Ecu to store information (e.g. crypto keys or certificates).

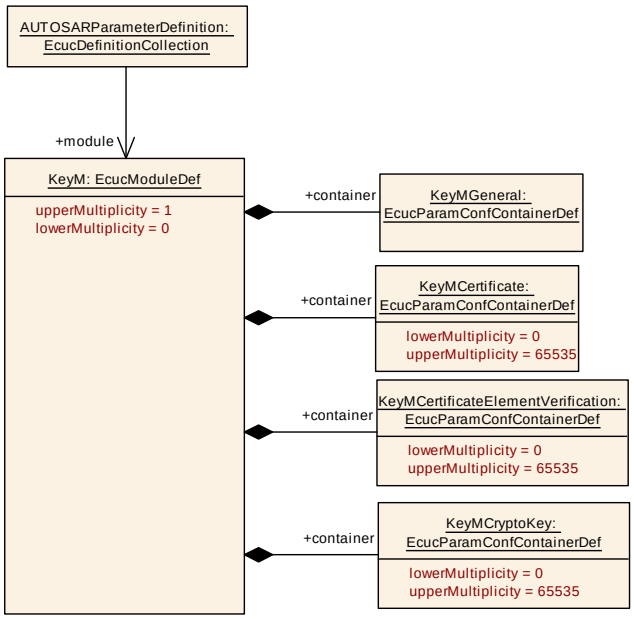

Figure 10.1: KeyM Definition

10.2.3 KeyMCertificate

SWS Item	[ECUC_KeyM_00003]
Container Name	KeyMCertificate
Parent Container	KeyM
Description	This container contains the certificate configuration.
Configuration Parameters	

SWS Item	[ECUC_KeyM_00029]		
Parameter Name	KeyMCertAlgorithmType		
Parent Container	KeyMCertificate		
Description	Specify in which format the certificate will be provided.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	ECC	ECC stands for uncompressed keys only.	
	RSA	–	
Post-Build Variant Value	false		
Value Configuration Class	**Pre-compile time**	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: local		

SWS Item	[ECUC_KeyM_00028]		
Parameter Name	KeyMCertFormatType		
Parent Container	KeyMCertificate		
Description	Specify in which format the certificate will be provided.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRL	–	
	CVC	–	
	X509	–	
Post-Build Variant Value	false		
Value Configuration Class	**Pre-compile time**	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: local		

SWS Item	[ECUC_KeyM_00022]	
Parameter Name	KeyMCertificateId	
Parent Container	KeyMCertificate	
Description	Identifier of the certificate. The set of configured identifiers shall be consecutive and gapless.	
Multiplicity	1	
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)	
Range	0 .. 65535	
Default value	–	
Post-Build Variant Value	false	

△

10.2.4 KeyMCertificateElement

SWS Item	[ECUC_KeyM_00035]		
Container Name	KeyMCertificateElement		
Parent Container	KeyMCertificate		
Description	This container contains the certificate element configuration.		
Configuration Parameters			

SWS Item	[ECUC_KeyM_00040]		
Parameter Name	KeyMCertificateElementHasIteration		
Parent Container	KeyMCertificateElement		
Description	Defines if the certificate element can occur more than one time. If so, the iterator can be used to retrieve the individual data values of this certificate element.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: local		

SWS Item	[ECUC_KeyM_00036]		
Parameter Name	KeyMCertificateElementId		
Parent Container	KeyMCertificateElement		
Description	Identifier of a certificate element.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: local		

SWS Item	[ECUC_KeyM_00039]		
Parameter Name	KeyMCertificateElementMaxLength		
Parent Container	KeyMCertificateElement		
Description	Maximum length in bytes		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 65535		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants

Container Name	**Multiplicity**	**Scope / Dependency**
KeyMCertificateCustomService	0..1	The presence of this container defines the custom processing for this certificate.

10.2.5 KeyMCertificateElementVerification

SWS Item	**[ECUC_KeyM_00004]**
Container Name	KeyMCertificateElementVerification
Parent Container	KeyM
Description	This container defines if and how certificate elements are to be verified.
Configuration Parameters	

Included Containers		
Container Name	**Multiplicity**	**Scope / Dependency**
KeyMCertificateElementCondition	1..*	This container contains the configuration of KeyElement compare conditions which can be used as arguments for a Key MCertificateElementRule. One KeyMCertificateElement Condition shall contain either one KeyMCertificateElementSwc Callback or one KeyMCertificateElementSwcSRDataElementRef or one KeyMCertificateElementSwcSRDataElementValueRef.

▽

△

Included Containers		
Container Name	**Multiplicity**	**Scope / Dependency**
KeyMCertificateElementRule	1..*	This container contains the configuration of a mode rule which represents a logical expression with KeyMCertificateElement Condition or other KeyMCertificateElementRule as arguments. All arguments are processed with the operator defined by Key MLogicalOperator, for instance: Argument_A AND Argument_B AND Argument_C.

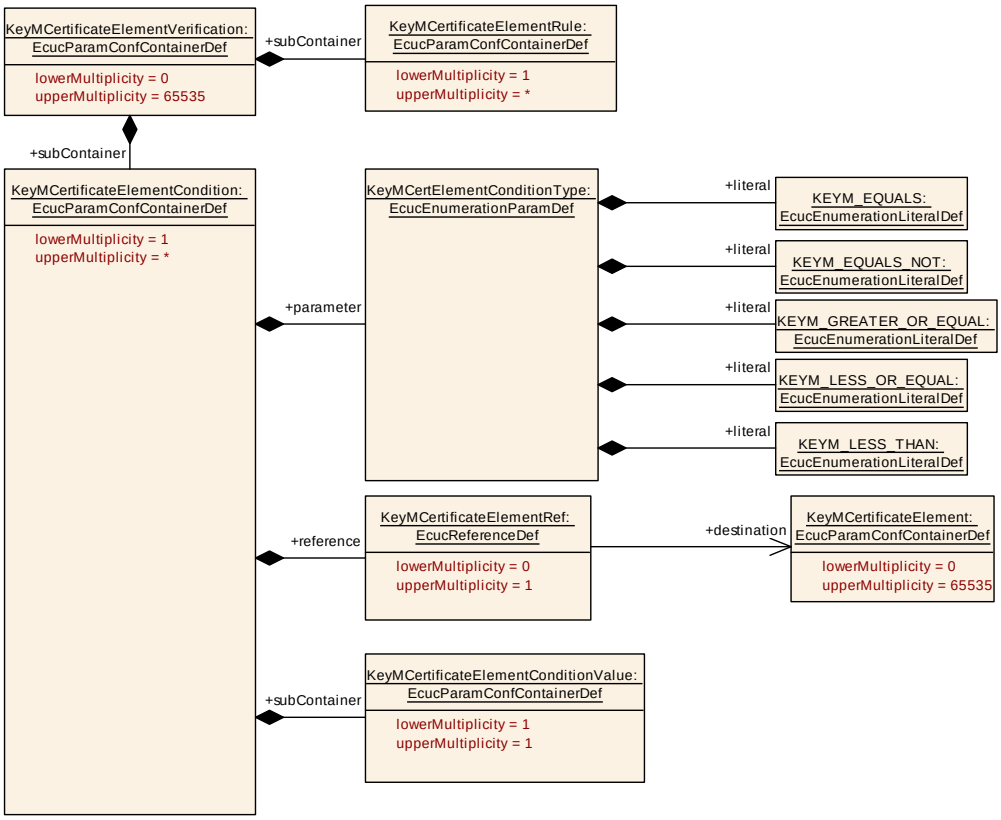

Figure 10.6: KeyMCertificateElementVerification Definition

10.2.13 KeyMCryptoKey

SWS Item	**[ECUC_KeyM_00005]**
Container Name	KeyMCryptoKey
Parent Container	KeyM
Description	This container contains the crypto keys that can be updated.
Configuration Parameters	

SWS Item	**[ECUC_KeyM_00067]**		
Parameter Name	KeyMCryptoCsmVerifyJobType		
Parent Container	KeyMCryptoKey		
Description	Specifies what type of function for key verification operation is used.		
Multiplicity	0..1		
Type	EcucEnumerationParamDef		
Range	KEYM_VERIFY_AEADDECRYPT	–	
	KEYM_VERIFY_AEADENCRYPT	–	
	KEYM_VERIFY_DECRYPT	–	
	KEYM_VERIFY_ENCRYPT	–	
	KEYM_VERIFY_MACGENERATE	–	
	KEYM_VERIFY_MACVERIFY	–	
Post-Build Variant Value	false		
Value Configuration Class	**Pre-compile time**	X	All Variants
	Link time	–	
	Post-build time	–	
Scope / Dependency	scope: local dependency: This parameter is only needed if KeymGeneral/KeyMCryptoKey/KeyMCryptoKeyVerifyFunctionEnabled is set to TRUE.		

SWS Item	**[ECUC_KeyM_00069]**
Parameter Name	KeyMCryptoKeyCryptoProps
Parent Container	KeyMCryptoKey

▽

△

Description	If set, it will provide additional hints to the crypto key that is used by KeyM to identify the key. Typical approach is to set the value to the SHE-Slot ID where the key was placed to. If present, the KeyM will take the information and identify the key by its slot ID. The slot information will be extracted from the corresponding field of the M1M2M3 data.		
Multiplicity	0..1		
Type	EcucStringParamDef

10.2.14 KeyMNvmBlock

SWS Item	[ECUC_KeyM_00070]
Container Name	KeyMNvmBlock
Parent Container	KeyM
Description	Configuration of optional usage of Nvm in case the KeyM module requires non volatile memory in the Ecu to store information (e.g. crypto keys or certificates).
Configuration Parameters	

SWS Item	[ECUC_KeyM_00072]		
Parameter Name	KeyMNvmBlockWriteDelayed		
Parent Container	KeyMNvmBlock		
Description	This is the delay time in ms to write a key to NVM after it has been updated. A value of 0 means, that the key is written immediately after it has been updated. If several keys are update that are assigned to the same container, the first delay time expiration shall be used. All keys that have been updated during that time shall be updated and its delay timer shall be stopped.		
Multiplicity	1

10.3 Published Information

For details refer to the chapter 10.3 'Published Information' in SWS_BSWGeneral.

Published information contains data defined by the implementer of the SW module that does not change when the module is adapted (i.e. configured) to the actual HW/SW environment. It thus contains version and manufacturer information.

A Not applicable requirements
