About IPNI

The International Plant Names Index (IPNI) is a database of the names and associated basic bibliographical details of seed plants, ferns and lycophytes. Its goal is to eliminate the need for repeated reference to primary sources for basic bibliographic information about plant names. The data are freely available and are gradually being standardized and checked. IPNI is a dynamic resource, depending on direct contributions by all members of the botanical community.

IPNI is the product of a collaboration between [The Royal Botanic Gardens, Kew](#), [The Harvard University Herbaria](#), and the [Australian National Herbarium](#).

NEWS

- [Melbourne Code](#) available online.
- From 1 January 2012 electronic material published online in Portable Document Format ([PDF](#)) with an International Standard Serial Number ([ISSN](#)) or an International Standard Book Number ([ISBN](#)) constitutes effective publication.

We want to make sure that IPNI captures all relevant nomenclatural novelties, whether published online or in printed form.

IPNI users can help. [Let us know](#) if you publish or find names in an online publication by sending us a link to the relevant site.

- To help you to quickly find information on authors, many new links have been created from author records to [TL-2](#) page in [BHL](#). Try it out. Click on the link in [this record](#).
- Some records now have a link to the protologue page in [BHL](#). See an example [here](#).
- [Missing protoglosses](#) - can you help us find some of these?

TIPS

- IMPORTANT: IPNI does not have information on what are currently accepted names and what are taxonomic (i.e. heterotypic) synonyms. Find this information in floras, monographs, checklists, revisions etc.
- See new names just added by [searching by additional terms](#). Search must be limited by at least one term, like family, genus or author.
- A hyperlink on author name or publication title in the detailed search results indicates standardized format.

Tropicos® was originally created for internal research but has since been made available to the world's scientific community. All of the nomenclatural, bibliographic, and specimen data accumulated in MBG's electronic databases during the past 30 years are publicly available here. This system has nearly 1.3 million scientific names and over 4.4 million specimen records.

The Plant List

A working list of all plant species

Home | About | Browse | Statistics | Feedback | How to use this site

2013 United Nations Decade on Biodiversity

Kew

MISSOURI BOTANICAL GARDEN

Global Composite Checklist

IPBES

IOPP

THE NEW YORK BOTANICAL GARDEN

I-P-N-I

The Plant List is a working list of all known plant species. It aims to be comprehensive for species of Vascular plant (flowering plants, conifers, ferns and their allies) and of *Bryophytes* (mosses and liverworts). Collaboration between the Royal Botanic Gardens, Kew and Missouri Botanical Garden enabled the creation of The Plant List by combining multiple checklist data sets held by these institutions and other collaborators. Version 1.1 (September 2013) replaces Version 1.0 which remains accessible here. Version 1.1 includes new data sets, updated versions of the original data sets and improved algorithms to resolve logical conflicts between those data sets. The differences between versions are summarised here. The Plant List provides the Accepted Latin name for most species, with links to all Synonyms by which that species has been known. Around 20% of names are unresolved indicating that the data sources included provided no evidence or view as to whether the name should be treated as accepted or not, or there were conflicting opinions that could not be readily resolved. The Plant List is not perfect and represents work in progress. Our aims remain to produce a 'best effort' list, to demonstrate progress and to stimulate further work. Important limitations are summarised here.

Summary Statistics

The Plant List includes 1,064,035 scientific plant names of species rank. Of these 350,699 are accepted species names.

The Plant List contains 642 plant families and 17,020 plant genera.

The status of the 1,064,035 species names, are as follows:

Status	Total
Accepted	350,699 33.0%
Synonym	470,624 44.0%
Unresolved	242,712 22.8%

The Plant List A working list of all plant species

Home | About | Browse | Statistics | Feedback | How to use this site |

The Plant List → Angiosperms

The Angiosperms (Flowering plants)

Angiosperms are seed-bearing vascular plants. Their reproductive structures are flowers in which the ovules are enclosed in an ovary. Angiosperms are found in almost every habitat from forests and grasslands to sea margins and deserts. Angiosperms display a huge variety of life forms including trees, herbs, submerged aquatics, bulbs and epiphytes. The largest plant families are Orchids, and Compositae (daisies) and Legumes (beans).

There are an estimated 352,000 species of flowering plants or *angiosperms*.

You can also browse genera found in *Angiosperms*.

View statistics at the bottom of the page.

The screenshot shows the IAPT website's main navigation menu. The logo at the top left features a globe with the text 'INTERNATIONAL ASSOCIATION FOR PLANT TAXONOMY' and 'iapt'. The menu items include: Introductory pages (Title page, Front matter, Editorial Committee, Preface, Re-numbering, Important dates); Preamble; Division I. Principles; Division II. Rules and Recommendations; Division III. Provisions for governance; Glossary; Indices; Appendices I-VII; and How to cite the *Code*.

International Code of Nomenclature for algae, fungi, and plants

The *International Code of Nomenclature for algae, fungi, and plants* is the set of rules and recommendations that govern the scientific naming of all organisms traditionally treated as algae, fungi, or plants, whether fossil or non-fossil, including blue-green algae (*Cyanobacteria*), chytrids, oomycetes, slime moulds, and photosynthetic protists with their taxonomically related non-photosynthetic groups (but excluding *Microsporidia*). Before 2011 it was called the *International Code of Botanical Nomenclature* (ICBN).

This edition of the *Code* embodies the decisions of the Nomenclature Section of the XIX International Botanical Congress (IBC), which took place in Shenzhen, China in July, 2017. This *Shenzhen Code* supersedes the *Melbourne Code* (McNeill & al. in *Regnum Veg.* 154. 2012), published after the XVIII IBC in Melbourne, Australia in 2011. The rules of the *Shenzhen Code* became effective immediately upon acceptance of the resolution at the closing plenary session of the XIX IBC on 29 July 2017, that the decisions and appointments of its Nomenclature Section be approved. The *Shenzhen Code* in its final form was published on 26 June 2018 (printed version). This electronic version was made available on 27 June 2018.

The screenshot shows the left sidebar of the IAPT website. At the top is the IAPT logo and a search bar. Below are several menu items: Introductory pages (Title page, Front matter, Editorial Committee, Preface, Re-numbering, Important dates), Preamble, Division I. Principles, Division II. Rules and Recommendations (Chapter I (Art. 1–5). Taxa and their ranks (Art. 1. Taxa, Art. 2. Ranks, Art. 3. Principal ranks, Art. 4. Secondary and further ranks, Art. 5. Order of ranks), Chapter II (Art. 6–15). Status, typification, and priority of names), and Chapter III (Art. 16–28). Nomenclature of taxa according to their rank.

DIVISION II RULES AND RECOMMENDATIONS

CHAPTER I TAXA AND THEIR RANKS

ARTICLE 1

1.1. Taxonomic groups at any rank will, in this *Code*, be referred to as taxa (singular: taxon).

1.2. A taxon (diatom taxa excepted) the name of which is based on a fossil type is a fossil-taxon. A fossil-taxon comprises the remains of one or more parts of the parent organism, or one or more of their life-history stages, in one or more preservational states, as indicated in the original or any subsequent description or diagnosis of the taxon (see also Art. 11.1 and 13.3).

Ex. 1. Allicopteris hallei J. Walton (in Ann. Bot. (Oxford), ser. 2, 13: 450. 1949) is a fossil-species for which the original description included rachides, sporangia, and spores of a pteridosperm, preserved in part as compressions and in part as petrifications.

Ex. 2. Protofagaceae allonenensis Herend. & al. (in Int. J. Pl. Sci. 156: 94. 1995) is a fossil-species for which the original description included dichasia of staminate flowers, with anthers containing pollen grains, fruits, and cupules, and thus comprises more than one part and more than one life-history stage.

Ex. 3. Stamnostoma A. G. Long (in Trans. Roy. Soc. Edinburgh 64: 212. 1960) is a fossil-genus that was originally described with a single species, *S. huttonense* A. G. Long, comprising anatomically preserved ovules with completely fused integuments forming an open collar around the lagenostome. Rothwell & Scott (in Rev. Palaeobot. Palynol. 72: 281. 1992) subsequently modified the description of the genus, expanding its circumscription to include also the cupules in which the ovules were borne. The name *Stamnostoma* can be applied to a genus with either circumscription or to any other that may involve other parts, life-history stages, or preservational states, so long as it includes *S. huttonense*, but not the type of any earlier legitimate generic name.

为什么要给植物命名？

平台培训班

分类等级

主要分类单位：界 kingdom (拉丁语<下同>regnum, s. n. II)

门 division 或 phylum (diviso, s. f. III. vi 或 phylum, s. n. II)

纲 class (classis, s. f. III. vii), 缩写 cl.

目 order (ordo, s. f. III. vi), 缩写 ord.

科 family (familia, s. f. I.), 缩写 fam.

属 genus (genus, s. n. III. iv), 缩写 gen.

种 species (species, s. f. VI.), 缩写 sp.

次级分类单位：族 tribe (tribus, s. f. IV.), 缩写 tr.

组 section (sectio, s. f. III. vi), 缩写 sect.

系 series (series, s. f. V.), 缩写 ser.

变种 variety (varietas, s. f. III. ii), 缩写 var.

变型 form (forma, s. f. I), 缩写 f.

亚种 subspecies、杂种 nothospecies 和亚属 subgenus 的缩写分别为 subsp.、nothosp. 和 subg.。

Recommendation 20A

20A.1. Authors forming generic names should comply with the following:

(i) Give **a feminine form** to all personal generic names, whether they commemorate a man or a woman (see Rec. 60B; see also Rec. 62A.1).

23.1. The name of a species is a binary combination consisting of the name of the genus followed by a single specific epithet in the form of an adjective, a noun in the genitive, or a word in apposition (see also Art. 23.6). If an epithet consisted originally of two or more words, these are to be united or hyphenated. An epithet not so joined when originally published is not to be rejected but, when used, is to be united or hyphenated, as specified in Art. 60.11.

23.5. The specific epithet, when **adjectival in form** and **not used as a noun**, **agrees with the gender of the generic name**; when the epithet **is a noun in apposition or a genitive noun**, it retains its own gender and termination irrespective of the gender of the generic name. Epithets not conforming to this rule are to be corrected (see Art. 32.2) to the proper form of the termination (Latin or transcribed Greek) of the original author(s). In particular, the usage of the word element *-cola* as an adjective is a correctable error.

《深圳法规》的主要变化

不管在任何时候，《法规》总是滞后于最先出现的问题，如同在商海中一样，没有《法规》能够制约暴发户，因为她们总具先知先觉的本领、总能超前一步、总能在《法规》出现时，快速逃离要有《法规》制约的战场，开辟新的还没有《法规》的战场。

Zhu • (062–063) Proposal to amend the Code

TAXON 52 • August 2003: 638

(062)–(063) Proposals to simplify author citation

Xiangyun Zhu

Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China. xiangyunzhu@ns.ibcas.ac.cn

For a long time, I have considered the authorship of the names of new taxa, new combinations and nomina nova published in books. These kinds of situations are different from each other. There may be many authors of editors of a book. Those authors may be the same as, partly the same as, or completely different from the authors of a subsection of that book (e.g., a family account in a flora). Similarly, the authorship ascribed to a name published in that book may have all, some, or no

关于“gathering”的概念

***gathering.* [Not defined] – used for a collection of one or more specimens made by the same collector(s) at the one place and time (Art. 8.2 and 8.3 footnote).**

OK

(030) To make a clearer definition of “gathering”

Xiang-Yun Zhu

State Key Laboratory of Systematic and Evolutionary Botany, The Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, China; xiangyunzhu@ibcas.ac.cn

DOI <http://dx.doi.org/10.12705/635.25>

During the course of his research on legume taxonomy, the present author encountered a publication (Zhu & al. in J. Wuhan Bot. Res. 26: 361. 2008) in which the holotype of the name of a new variety, *Glycine soja* var. *cleistogama* C.S. Zhu & S.X. Zhu, was designated as two collection numbers, *C. S. Zhu 060256* and *C. S. Zhu 060257*. Based on the present definition of “gathering” in the Glossary of the *Melbourne Code* (McNeill & al. in Regnum Veg. 154: 156. 2012), two

results could be reached. One is that the two collection numbers belong to one gathering and the name of this variety was validly published. The other is that the name of the variety was not validly published because two gatherings were designated as the type and therefore the type was not indicated as required by Art. 40.1 and as permitted by Art. 40.2. It could be misunderstood that a specimen with two collection numbers must automatically represent two gatherings, but this is not

Zhu • (030) Glossary

TAXON 63 (5) • October 2014: 1145–11

33%

necessarily so according to the present definition of a gathering. For a clearer understanding of what constitutes a gathering, the present author suggests a small addition to the present Glossary definition.

(030) Amend the Glossary entry for “gathering” as follows (addition shown in boldface):

“*gathering*. [Not defined]—used for a collection of one or more specimens made by the same collector(s) at the one place and time

irrespective of whether it bears one or more collection numbers
(Art. 8.2 and 8.3 footnote).”

(1. Henan Agricultural University, Zhengzhou 450002, China; 2. Bioengineering Department, Zhengzhou University, Zhengzhou 450001, China; 3. Zhengzhou Teachers College, Zhengzhou 450044, China)

Abstract: A new variety (*Glycine soja* Sieb. et Zucc. var. *cleistogama* C. S. Zhu et S. X. Zhu) from Henan Province, China is described.

Key words: *Glycine* Willd.; *Glycine soja* Sieb. et Zucc. var. *cleistogama* C. S. Zhu et S. X. Zhu; New variety

闭花野大豆 新变种

Glycine soja Sieb. et Zucc. var. *cleistogama* C. S.

Zhu et S. X. Zhu, var. nov.

A var. *soja* differt floribus omnibus clausis, parvioribus, 2.5 – 3 (3.5) mm longis; dentibus calycis conniventibus; petalis in calyce reconditis, longitudine 1/2 – 2/3 calycis partes aequantibus; carinis alas aequantibus vel alis longioribus, alis sesquilateralibus; androecio redacto, antheris (2) 3 – 4 (5) fertilibus.

Henan(河南): Tongbai(桐柏), Chenzhuang(陈庄), alt. 400 m, 2005-08-21, Zhu Changshan (朱长

山) 05016, 05017, 05018 (HNAC); Gumião (固庙), 2006-08-14, Zhu Changshan, Zhang Yunxia (张云霞) 060173, 060174 (HNAC). Zhengzhou (郑州), Huayankou (花园口), alt. 200 m, ad ripas fluviorum et agrorum versuras, 2006-08-25. Zhu Changshan 060256, 060257 (holotypus, hic designatus, HNAC).

本变种与原变种不同在于: 花全为闭锁花, 较小, 长仅 2.5 ~ 3 (3.5) mm, 萼齿靠合, 不张开; 花瓣隐藏于萼内, 长为萼的 1/2 ~ 2/3, 龙骨瓣等长于或长于翼瓣, 宽为翼瓣的 1.5 倍; 雄蕊群退化, 能育花药(2)3 ~ 4(5)枚。模式标本存放于河南农业大学植物标本室(HNAC)。

deleted

gathering. A collection presumed to be of a single taxon made by the **same collector(s)** at the **same time** from a **single locality** (Art. 8.2 footnote; see also Art. 8 Note 1).

8 Note 1. Field numbers, collecting numbers, accession numbers, or specimen identifiers alone do not necessarily denote different gatherings.

Ex. 4. Solidago ×snarskisii Gudžinskas & Žalneravičius (in Phytotaxa 253: 148. 2016) was validly published ([Art. 40.2](#)) with a single gathering in BILAS indicated as type, the parts of which were numbered separately in the field, mounted on separate sheets and designated as follows: “**Holotype**—LITHUANIA. Trakai district, Aukštadvaris Regional Park, environs of Zabarauskai village, in an abandoned meadow on the edge of forest (54.555191° N; 24.512987° E), 13 September 2014, Z. Gudžinskas & E. Žalneravičius **76801** (generative shoot) and **76802** (vegetative shoot) (BILAS, on two cross-referenced sheets). Isotypes:—Z. Gudžinskas & E. Žalneravičius **76803**, **76804** (BILAS).”

40.1. Publication on or after 1 January 1958 of the name of a new taxon at the rank of genus or below is valid only when the type of the name is indicated (see Art. 7–10; but see Art. H.9 Note 1 for the names of certain hybrids).

40.2. For the name of a new species or infraspecific taxon, indication of the type as required by Art. 40.1 can be achieved by reference to an entire gathering, or a part thereof, even if it consists of two or more specimens as defined in Art. 8 (see also Art. 40.7).

Ex. 1. When Cheng described “*Gnetum cleistostachyum*” (in *Acta Phytotax. Sin.* 13(4): 89. 1975) the name was not validly published because two gatherings were designated as types: *K. H. Tsai* 142 (as “♀ Typus”) and *X. Jiang* 127 (as “♂ Typus”).

Note 1. When the type is indicated by reference to an entire gathering, or a part thereof, that consists of more than one specimen, those specimens are syntypes (see [Art. 9.6](#)).

Ex. 2. The protologue of *Laurentia frontidentata* E. Wimm. (in Engler, Pflanzenr. IV. 276 (Heft 108): 855. 1968) includes the type statement “*E. Esterhuysen No. 17070!* Typus – Pret., Bol.” The name is validly published because a single gathering is cited, despite the mention of duplicate specimens (syntypes) in two different herbaria, and [Art. 40.7](#) does not apply.

Ex. 3. Radcliffe-Smith (in Gen. Croton. Madag. Comoro: 169. 2016) indicated the type of *Croton nitidulus* var. *acuminatus* Radcl.-Sm. as “*Cours 4871* (holotypus P)”. In the herbarium P there are four duplicates of *Cours 4871*. The name is validly published because a single gathering in a single herbarium was indicated as type. These specimens are syntypes, and one of them was subsequently designated as the lectotype by Berry & al. (in Phytokeys 90: 69. 2017).

60.8. The termination of specific or infraspecific epithets derived from personal names that are not already in Greek or Latin and do not possess a well-established latinized form (see [Rec. 60C.1](#)) is as follows:

(a) If the personal name ends with a vowel or -er, substantival epithets are formed by adding the genitive inflection appropriate to the gender and number of the person(s) honoured (e.g. *scopoli-i* for Scopoli (m), *fedtschenko-i* for Fedtschenko (m), *fedtschenko-ae* for Fedtschenko (f), *glaziou-i* for Glaziou (m), *lace-ae* for Lace (f), *gray-i* for Gray (m), *hooker-orum* for the Hookers (m)), except when the name ends with -a, in which case adding -e (singular) or -rum (plural) is appropriate (e.g. *triana-e* for Triana (m), *pojarkova-e* for Pojarkova (f), *orlovskaja-e* for Orlovskaja (f)).

(b) If the personal name ends with a consonant (but not in -er), substantival epithets are formed by adding -i- (stem augmentation) plus the genitive inflection appropriate to the gender and number of the person(s) honoured (e.g. *lecard-ii* for Lecard (m), *wilson-iae* for Wilson (f), *verlot-iorum* for the Verlot brothers, *braun-iarum* for the Braun sisters, *mason-iorum* for Mason, father and daughter).

(c) If the personal name ends with a vowel, adjectival epithets are formed by adding *-an-* plus the nominative singular inflection appropriate to the gender of the generic name (e.g. *Cyperus heyne-anus* for Heyne, *Vanda lindley-ana* for Lindley, *Aspidium bertero-anum* for Bertero), except when the personal name ends with *-a* in which case *-n-* plus the appropriate inflection is added (e.g. *balansa-nus* (m), *balansa-na* (f), and *balansa-num* (n) for Balansa).

(d) If the personal name ends with a consonant, adjectival epithets are formed by adding *-i-* (stem augmentation) plus *-an-* (stem of adjectival suffix) plus the nominative singular inflection appropriate to the gender of the generic name (e.g. *Rosa webb-iana* for Webb, *Desmodium griffith-ianum* for Griffith, *Verbena hassler-iana* for Hassler).

Terminations contrary to the above standards are treated as errors to be corrected to *-[i]i*, *-[i]ae*, *-[i]ana*, *-[i]anus*, *-[i]anum*, *-[i]arum*, or *-[i]orum*, as appropriate (see also [Art. 32.2](#)). However, epithets formed in accordance with [Rec. 60C.1](#) are not correctable (see also [Art. 60.9](#)).

Resolution 1

The XIX International Botanical Congress in Shenzhen, China resolves that the decisions of its Nomenclature Section with respect to the International Code of Nomenclature for algae, fungi, and plants, as well as the appointment of the Rapporteur-général, Secretary of the Fungal Nomenclature Bureau, and officers and members of the Permanent Nomenclature Committees, made by that Section during its meetings from 17th to 21st of July, 2017, be accepted; noting with interest the mechanism for creating a framework for future registration of algal and plant names, provisions for improved clarity in the governance of the Code and the working of future Nomenclature Sections, and the sharing of governance of nomenclature by referring decisions on rules solely relating to fungi to International Mycological Congresses.

42.1. Interested institutions, in particular those with expertise in nomenclatural indexing, may apply for recognition as nomenclatural repositories under this Code. A nomenclatural repository takes charge, for specified categories of organisms, of registering nomenclatural novelties (Art. 6 Note 4) and/or any nomenclatural act (Art. 34.1 footnote).

“单属、种”案例

38.5. The names of a genus and a species may be validly published simultaneously by provision of a single description (*descriptio generico-specifica*) or diagnosis, even though this may have been intended as only generic or specific, if all of the following conditions are satisfied: (a) the genus is at that time monotypic (see Art. 38.6); (b) no other names (at any rank) have previously been validly published based on the same type; and (c) the names of the genus and species otherwise fulfil the requirements for valid publication. A *descriptio generico-specifica* must accompany the names of the taxa described; reference instead to an earlier description or diagnosis is not acceptable.

中国竹亚科一新属—酸竹属

朱政德 赵奇僧

酸竹属是近年来研究我国竹亚科分类中发现的一个新属，在系统发育上隶属于箭竹族。现报道如下。

酸竹属 新属 图版 I

乔木，地下茎单轴型。秆直立，圆筒形，分枝一侧节上微有沟槽，秆中部每节分枝3，上部分枝5，秆环微隆起；秆箨脱落性，箨叶小；叶片大小变化，通常较大，侧脉多数，网脉明显。圆锥花序或总状花序顶生，由3—5小穗组成，小穗柄细长，小穗粗壮，颖片4，小花多数，外稃大，多脉，网脉明显，内稃具2脊，无毛，先端渐尖，鳞被3，无毛，边缘透明，雄蕊6，子房纺锤状，花柱极短，柱头3，羽毛状。果未见。

新属在亲缘关系上接近赤竹属 *Sasa*，但本属为乔木，地下茎单轴型，秆每节分枝3；秆箨早落；小穗粗壮，内稃先端渐尖，而赤竹属为小型竹种，地下茎复轴型，秆每节1分枝，且与主秆近等粗；秆箨宿存；小穗较小，内稃先端常2裂。在系统发育上新属较赤竹属为原始。本属每节分枝3，小花具6个雄蕊等特征，又与大节竹属 *Indosasa* 有些相似，但本属为顶生的圆锥花序或总状花序，开展，小穗具柄，细长，而大节竹属则由假小穗组成的假花序，假小穗单生或分枝呈小穗丛，无柄，生于其叶小枝下部节上，故两者在亲缘关系上并不接近。

1种，分布于我国南方。

Acidosasa C. D. Chu et C. S. Chao, gen. nov.

Tribus Arundinarieae Steudel

Arbuscula, rhizome monopodial; culm erect, internodiis teretibus vel supra ramos leviter sulcatis; Rami primarii medio culmi in quoque nodo 3, superne 5, nodis paullo prominentibus; Vaginae culmorum deciduae, laminis minoribus; Foliorum laminis

sellatis; Inflorescentia paniculata vel racemosa, terminales; Spiculae 3—5, robustae, pedicellis gracilibus, glumis vacuis 4, flosculis numerosis, lemmatibus magnis multinevibus, conspicue tessellatis, paleis bicarinatis, glabris, apice acuminatis, Iodiculis 3, glabris, margine hyalinis, staminibus 6, ovario fusiformi, stylo 1, brevissimo, stigmatibus 3, plumosis. Fructu maturo incognito.

ina Academic Journal Electronic Publishing House. All rights reserved. <http://www.cnki.net>

Genus novum Sasae Makino et Shihata affinis, sed differt a *Sasa arbusculis*, I - ramis primariis in quoque nodo, spiculis robustis, paleis apice acuminatis. Hoc genus staminibus 6 in flosculo et 3 ramis primariis in nodo Indosasae McCl. similis, sed distinct differt a *Indosasa inflorescentibus paniculatis vel racemosis*, terminalibus patentibus, pedicellis gracilibus, autem *Indosasa pseudospiculis sessilibus*, solitariis vel ramosis, aggregatis e inferiore nodo cum ramulo foliifero prodientibus.

Species unica infia descripta Chiae australis incola.

酸竹 (广东阳春) 新种 图版 1

秆高 8 米, 径 3—5 厘米, 中部节间长约 20 厘米, 耻绿色, 起初密被短硬毛, 后无毛, 具明显的细条纹, 耻环与箨环微隆起; 箧先端扁平, 耻箨质脆, 暗红色, 被易落的短硬毛, 疏生斑点, 网脉明显, 边缘具缘毛, 先端渐窄, 无箨耳和箨毛, 箧叶小, 披针形, 长 1.5—4.5 厘米, 宽不及 1 厘米, 箧舌短, 弓形, 先端具流苏状短纤毛, 每小枝 2—5 叶, 叶鞘无毛, 通常无叶耳和箨毛, 叶片大小有变化, 11×2, 20×3, 29×4.5, 30×6.5 厘米, 但通常较大, 先端渐尖, 基部渐窄, 两边有锯齿, 侧脉 6—11 对, 无毛; 花枝细, 长 10—26 厘米, 苞片细小, 三角形, 先端长尾尖; 小穗 3—5, 长 3—10 厘米, 宽 3—6 毫米, 通常长 5—6 厘米, 小穗柄细, 长 1.5—4 厘米, 无毛, 颖片 4, 无毛, 具光泽, I 长 3 毫米, 3 脉, II 长 7 毫米, 9 脉, III 长 12 毫米, 11 脉, IV 长 16 毫米, 多脉, 稃状, 小花 3—18, 通常 8—9, 外稃长 2.2 厘米, 宽 0.9—1 厘米, 先端渐尖, 无毛, 具光泽, 17—19 脉, 网脉清楚, 内稃较

长7毫米，9脉，Ⅲ长12毫米，11脉，Ⅳ长16毫米，多脉，稃状，小花3—18，通常8—9，外稃长2.2厘米，宽0.9—1厘米，先端渐尖，无毛，具光泽，17—19脉，网脉清楚，内稃较窄，长1.2厘米，2脊状，无毛，小穗轴长6—7毫米，无毛，雄蕊6，未开放前花药长5毫米，黄色，鳞被3，椭圆状披针形，长5—6毫米，淡褐色，边缘透明，无毛，柱头长5毫米。

广东：阳春县，河尾山海拔700米，梁葵69503（花模式标本，存南京林产工业学院树木标本室，等模式标本存华南农学院树木标本室）；同地点，朱政德、王正7924（营养体模式标本，存南京林产工业学院树木标本室）；同地点，梁宝汉89477（华南农学院树木标本室）；同地点，湛江植物调查队4211（中国科学院华南植物研究所）。

Acidosasa chinensis C. D. Chu et C. S. Chao, sp. nov.

Culmi usque ad 8 m. alti et 3-5 cm. diam. intrnodiis circ. 20 cm. longis, viridibus initio dense brevi-hispidis, deinde glabris, conspicue striolatis, nodis cicatricesque paullo prominentibus, Turiones juvenales apice plano-compessi. Vaginae culmorum in texturo crustaceac; fulvo-rubescentes, dorso breve hispidae, pilis caducis, sparse maculatae, conspicue tessellatae, margine ciliatae, apicem versus angustatae, auriculis et setis oralibus non evolutae, ligulis brevis arcuatis, apice breve fimbriatis, laminis parvis lanceolatis, 1.5-4.5cm. longis, infia 1 cm. latis. Folia in quoque ramulo 2-5, foliorum vaginis glabris, auriculis et setis oralibus plerumque nullis, laminis variabilibus, 11 x 2, 20 x 3, 29 x 4.5, 30 x 6.5 cm. sed plerumque majoribus, apice acuminatis basim versus angustatis, margine serrulatis, nevis secundariis 6-11-jugis. glabris. Inflorescentia cum ramulo usque ad 10-26 cm. longa, bracteis minimis, triangulis, apice longicaudatis. Spiculae 3-5, 3-10 cm. longae, 3-6 mm. latae, plerumque 5-6 cm. longae, pedicellis gracilibus, 1.5-1 cm. longis, glabris, glumis 4, glabris, nitidis, 1: 3 mm. longis

— 113 —

0.9-1 cm. latis, apice acuminatis, glabris, nitidis, 17-19-nevis, conspicue tessellatis, paleis angustatis, 1.2 cm. longis, bicarinatis, glabris, rhachillis 6-7 mm. longis, glabris, staminibus 6, antheris ante anthesin 5 mm. longis, flavis; lodiculis 3, elliptico-lanceolatis, 5-6 mm. longis brunneolis, margine hyalinis, glabris, stigmatibus 5 mm. longis.

Guang-dong: Yang-chun Dist. He-wei-shan alt. 700 m. Liang-kui 69503 (Fl. Typus, in Herb. Nank. Techn. Coll. For. Prod.), Chu Cheng-de et Wang-Zheng 7924 (Veg. Typus, ut supra).

该竹属的发现不仅丰富了我国竹亚科的属种资源，而且对研究竹亚科的系统发育，尤其是赤竹属的起源问题，提供了新的资料。

ACIDOSASA—A NEW GENUS OF CHINESE BAMBUSOIDEAE

Chu Chengde Chao Chason

(Summary)

Acidosasa, a new genus of Bambusoideae, was discovered in South China by the authors as they engaged in the study of the taxonomy of Chinese bamboos recent years. It belongs to the tribe Arundinarieae taxonomically.

This new genus is affinis to the genus Sasa Makino et Shibata but more primitive than the latter by the arboreous habit and some other characters. It is also somewhat similar to the genus Indosasa McCl. but differs from its particular spikelets.

The comprehensive characters of this new genus and only one new species (*Acidosasa chinensis*) known nowadays are studied morphologically in detail, with Chinese-Latin descriptions and drawings given also.

The significance of the discovery of this new genus may however be valuable to the study of the resources of Chinese bamboos particularly to the research of systematic and phylogenetic purposes.

40.1. Publication on or after 1 January 1958 of the name of a new taxon at the rank of genus or below is valid only when the type of the name is indicated (see Art. 7–10; but see Art. H.9 Note 1 for the names of certain hybrids).

Metasequoia n. g. (Pl. V A-D, Fig. 8 A-H)

The remains have usually been referred to *Sequoia* or *Taxodium*, indeed the cone is like that of *Sequoia* and the foliage shoot is somewhat like those of *Taxodium*.

The cones were never found connected to branches, but as the leaf-scares on the peduncle are also distichous, it is conceivable that the cones and the shoots belonged to the same plant. The foliated shoots seem to be lateral branches shedding in autumn, because their length is usually constant and the proximal end is covered by scaly leaves, although they have no scaly bud on the top and the branches two or more years old have two or more bud scars on the nearly same point as in Fig. 8 Ge.

The cone is distinguished from that of *Sequoia* by the decussate arrangement of scales and by the delicate peduncle having scale leaves at the base. The foliated shoot differs from *Sequoia* by distichous arrangement of leaves and by the brittle petiole. At a glance the shape of the shoot of fragmental remain seems to be *Taxodium* or *Cephalotaxus* but it differs from *Taxodium*⁽¹⁾ by distichous leaf and parallel arrangement of stomata on it and from *Cephalotaxus* by short delicate shoot without scaly bud at the terminal and by the obtuse top of leaf.

The decussate arrangement of cone-scales is not found in living Taxodiaceae, but a common character in Cupressaceae. The shedding of lateral foliated shoot with linear leaves is common in *Glyptostrobus* and *Taxodium*. So it is sure that the remains belong to Taxodiaceae but as the characters do not harmonize with those of the living forms,

characteristics of the vegetative and floral organs, although differing in the characters of pollen and wood anatomy. In these respects *Metasequoia* is closely allied to *Sequoia* and *Sequoiadendron*.

The following are the diagnoses of the new family, the genus *Metasequoia* and the living species, *M. glyptostroboides*:

METASEQUOIACEAE Hu et Cheng, fam. nov.

Flores monoecii, solitarii; masculi solitarii terminales et axillares oppositi, perulis decussatis, in ramuli florum racemosi vel paniculati; androecium staminibus circiter 20, filamentis brevibus, loculis antherac 3, pollina non-alata; feminei solitarii, ovulis 5-9, erectis, perulis 14-16, decussatis; pedunculi foliis distichis, oppositis linearibus. Strobili penduli; squamae lignosae, decussatae, peltatae; semina 5-9, compressa, alis lateralibus.—Arbor ramis oppositis, ramulis lateralibus oppositis, distiche dispositis, deciduis in hiemo; folia decidua, opposita, distiche disposita, linearia, sessilia vel presque sessilia, subtus duabus fasciebus stomatiferis ornatae c seriebus stomatum 4-6 compositis. Cotyledonares 2.

Tree with opposite branchlets and opposite, distichously arranged foliage shoots deciduous in winter. Leaves deciduous, opposite, distichously arranged, linear, sessile or nearly sessile, with 4-6 rows of stomata on each side beneath. Flowers solitary, monoecious. Staminate flowers axillary and terminal, opposite, on racemose or paniculate flowering branchlet-system; bracts decussate; androecium with about 20 stamens; stamen-filaments short, anthers 3-celled, pollen-grains not winged. Pistillate flowers solitary; bracts 14-16, decussate; peduncles leafy, with distichous opposite linear leaves. Cones pendulous; scales woody, decussate, peltate; seeds 5-9 under each scale, compressed, winged all round; cotyledons 2.

This family has 10 fossil and 1 living species widely distributed in Europe, Asia and North America, from Cretaceous to Pliocene time.

Metasequoia Miki in Jap. Journ. Bot. 10:261 (1941).

Characters of the family.

1948

HU & CHENG: NEW FAMILY METASEQUOIACEAE

157

disk with a transverse median depression, 7-9 mm. high, 18-21 mm. across at the upper disk; peduncles glabrous, terete, green when young, becoming light brown or brown later, with decussate, linear leaves before maturity, and with conspicuous leaf scars and with persistent bracts at the base in winter; seeds 5-9 under each scale, seed-wing all round, compressed, obovate, rarely orbicular-oblong, notched at the apex, 5 mm. long, 4 mm. broad; cotyledons 2.

China: E. Szechuan, Wanhsien, Mo-tao-hsi, road side, by stream, alt. 1100 m., *C. J. Hsueh* no. 5, type in flowers and cones without foliage shoots, Feb. 20, 1946; same locality, same tree, *C. J. Hsueh* no. 51 in young cones with foliage shoots, May 18, 1946; same locality, same tree, *C. T. Hwa* no. 2, type in cones with foliage shoots, Sept. 12, 1947, nos. 179, 180, 181, Sept. 21 to Nov. 1, 1947; SW. Hupeh, Lichuanhsien, Houng-pan-ying by stream, alt. 1300 m., *C. T. Hwa* no. 26, Sept. 14, 1947; Lichuanhsien, Jao-Yu-Tai, near Wang-kia-ying, on open slope, alt 1200 m., Oct. 20, 1947; Lichuanhsien, Shui-sa-pa Valley, alt. 900-1350 m., no. 183, Oct. 25, 1947.

Among the fossil species the senior author mentioned in his paper the type species, *Metasequoia disticha* (Heer) Miki, and *M. japonica* (Endo) Miki from the pliocene beds in Japan and *M. chinensis* (Endo) Hu in eocene beds in Fushun coal mines in southern Manchuria and in Kawakami coal mines in southern Saghalien. Professor Ralph W. Chaney communicated to him that *Sequoia macrolepis* Heer, *S. fastigiata* Sternberg, *S. cocinea* Heer, *S. Langsdorffii* Heer, *S. Nordenstkioldii* Heer, *S. Reichenbachii* Heer, *S. gracilis* and *S. Heerii* Lesquereux all should be referred to the genus *Metasequoia*. Hence the following new combinations:

Metasequoia macrolepis Chaney, comb. nov.

Sequoia macrolepis Heer, Fl. Foss. Arct. 7: 16, pl. 51, f. 1.

Metasequoia fastigiata Chaney, comb. nov.

43.1. In order to be validly published, a name of a new fossil-taxon published **on or after 1 January 1996** must be accompanied by a Latin or English description or diagnosis or by a reference (see Art. 38.13) to a previously and effectively published Latin or English description or diagnosis.

Note 1. Because Art. 39.1 does not apply to names of fossil-taxa, a validating description or diagnosis (see Art. 38) in **any language** is acceptable for them prior to 1996.

ON THE NEW FAMILY METASEQUOIACEAE AND ON
METASEQUOIA GLYPTOSTROBOIDES, A LIVING
SPECIES OF THE GENUS METASEQUOIA
FOUND IN SZECHUAN AND HUPEH

by

Hsen-Hsu Hu

(Fan Memorial Institute of Biology)

and

Wan-Chun Cheng

(National Central University, Nanking)

In December 1946, the senior author published a paper, "Notes on a Palaeogene Species of *Metasequoia* in China", in which he reported that the junior author discovered in Wan Hsien, Szechuan, a living species of this genus. From both of the fossil and the living species it was found that this genus is characterized by the deciduous distichous leaves twisted at base and by the long-stalked cones with decussate scales. Besides these characteristics it further differs from both the genera *Sequoia* and *Sequoiadendron*, its close allies, in opposite branchlets, in opposite distichously arranged deciduous leafy shoots and in opposite staminate flowers arranged on racemose or paniculate flowering branchlets-system and with decussate bracts. The decussate characteristics of all its vegetative and floral organs make this genus strikingly distinguished from all other genera of the family *Taxodiaceae*. Professor Ralph W. Chaney communicated to the authors with the fact that before mid-miocene age there was not a single species of fossil *Sequoia* discovered in Europe, Asia or North America, and all the fossil species recorded in older beds are *Metasequoias*. This means that the genera *Sequoia* and *Sequoiadendron* may have been derived from the genus *Metasequoia*. This fact and the morphological characteristics distinguishing *Metasequoia* from *Sequoia* and *Sequoiadendron* and other genera of the family *Taxodiaceae* entitle this genus to be elevated to the familial rank. Hence the family *Metasequoiaciae* is here proposed. This new family should also be considered as the ancestral stock of the family *Cupressaceae*, which is definitely allied to this family in the opposite

characteristics of the vegetative and floral organs, although differing in the characters of pollen and wood anatomy. In these respects *Metasequoia* is closely allied to *Sequoia* and *Sequoiodendron*.

The following are the diagnoses of the new family, the genus *Metasequoia* and the living species, *M. glyptostroboides*:

METASEQUOIACEAE Hu et Cheng, fam. nov.

Flores monoeci, solitarii; masculi solitarii terminales et axilares oppositi, perulis decussatis, in ramuli florum racemosi vel paniculati; androecium staminibus circiter 20, filamentis brevibus, loculis antherae 3, pollina non-alata; feminei solitarii, ovulis 5-9, erectis, perulis 14-16, decussatis; pedunculi foliis distichis, oppositis linearibus. Strobili penduli; squamae lignosae, decussatae, peltatae; semina 5-9, compressa, alis lateralibus.—Arbor ramis oppositis, ramulis lateralibus oppositis, distiche dispositis, deciduis in hieme; folia decidua, opposita, distiche disposita, linearia, sessilia vel presque sessilia, subtus duabus fasciebus stomatiferis ornatae e seriebus stomatum 4-6 compositis. Cotyledonares 2.

Tree with opposite branchlets and opposite, distichously arranged foliage shoots deciduous in winter. Leaves deciduous, opposite, distichously arranged, linear, sessile or nearly sessile, with 4-6 rows of stomata on each side beneath. Flowers solitary, monoecious. Stamine flowers axillary and terminal, opposite, on racemose or paniculate flowering branchlet-system; bracts decussate; androecium with about 20 stamens; stamen-filaments short, anthers 3-celled, pollen-grains not winged. Pistillate flowers solitary; bracts 14-16, decussate; peduncles leafy, with distichous opposite linear leaves. Cones pendulous; scales woody, decussate, peltate; seeds 5-9 under each scale, compressed, winged all round; cotyledons 2.

This family has 10 fossil and 1 living species widely distributed in Europe, Asia and North America, from Cretaceous to Pliocene time.

Metasequoia Hu & W. C. Cheng in Bull. Fan Mem. Inst. Biol., Bot., ser. 2, 1: 154. 15 Mai 1948 [Pin.].
Typus: *M. glyptostroboides* Hu & W. C. Cheng (typ. cons.).

(H) **Metasequoia** Miki in Jap. J. Bot. 11: 261. 1941 (post Mar) [Foss.].
Typus: *M. disticha* (Heer) Miki (*Sequoia disticha* Heer).

11.8. Names of organisms (diatoms excepted) based on a non-fossil type are treated as having priority over names at the same rank based on a fossil type where these names are treated as synonyms for a non-fossil taxon.

Ex. 32. The generic name *Metasequoia* Miki (in Jap. J. Bot. 11: 261. 1941) was based on the fossil type of *M. disticha* (Heer) Miki. After discovery of the non-fossil species *M. glyptostroboides* Hu & W. C. Cheng, conservation of *Metasequoia* Hu & W. C. Cheng (in Bull. Fan Mem. Inst. Biol., Bot., ser. 2, 1: 154. 1948) as based on the non-fossil type was approved. Otherwise, any new generic name based on *M. glyptostroboides* would have been treated as having priority over *Metasequoia* Miki.

原产美国加利福尼亚州海岸。我国上海、南京、杭州引种栽培。

9. 水杉属—*Metasequoia* Miki ex Hu et Cheng

Miki in Jap. Journ. Bot. 9: 261. 1841; 胡先骕、郑万钧,

静生汇报 1 (2): 154. 1948.

落叶乔木，大枝不规则轮生，小枝对生或近对生；冬芽有6—8对交叉对生的芽鳞。叶交叉对生，基部扭转列成二列，羽状，条形，扁平，柔软，无柄或几无柄，上面中脉凹下，下面中脉隆起，每边各有4—8条气孔线，冬季与侧生小枝一同脱落。雌雄同株，球花茎部有交叉对生的苞片；雄球花单生叶腋或枝顶，有短梗，球花枝呈总状花序状或圆锥花序状，雄蕊交叉对生，约20枚，每雄蕊有3花药，花丝短，药隔显著，药室纵裂，花粉无气囊；雌球花有短梗，单生于去年生枝顶或近枝顶，梗上有交叉对生的条形叶，珠鳞11—14对，交叉对生，每珠鳞有5—9枚胚珠。球果下垂，当年成熟，近球形，微具四棱，稀成矩圆状球形，有长梗；种鳞木质，盾形，交叉对生，顶部横长斜方形，有凹槽，基部楔形，宿存，发育种鳞有5—9粒种子，种子扁平，周围有窄翅，先端有凹缺；子叶2，发芽时出土。

本属模式种：水杉 *Metasequoia glyptostroboides* Hu et Cheng

本属在中生代白垩纪及新生代约有10种，曾广布于北美、日本、我国东北、苏联西伯利亚、欧洲及格陵兰，北达北纬82度。第四纪冰期之后，几全部绝灭，现仅有1种遗种，产于我国四川东部（石柱县）及湖北西南部（利川）、湖南西北部（龙山及桑植）山区。现普遍栽培，为速生造林树种及园林树种。

水杉属在系统发育上与北美红杉属（*Sequoia*）有密切的亲缘关系。它具长枝及冬季脱落性短枝，又近似水松属（*Glyptostrobus*）和落羽杉属（*Taxodium*），而叶及珠鳞、种鳞对生则易与其他属种区别。

8. METASEQUOIA Hu & W. C. Cheng, Bull. Fan Mem. Inst. Biol., n.s., 1: 154. 1948, nom. cons.

水杉 shui shan
Trees deciduous, monoecious; main branches irregularly whorled; branchlets of several kinds: persistent or deciduous, opposite or subopposite, developing from paired, superimposed axillary buds, 1 of which remains dormant as a winter bud; winter buds ovoid or ellipsoid, with 6–8 pairs of decussate, ovate, membranous, scales; branchlets each subtended by ca. 4 whorls of early deciduous, salmon-colored basal scales. Leaves deciduous together with lateral branchlet as a unit, decussate, 2-ranked, spirally arranged on leading branchlets, ± sessile; blade linear, flattened, soft, midvein depressed adaxially, raised abaxially, stomatal bands 4–8, on abaxial surface only, or on both surfaces on seedling leaves, base twisted. Pollen cones developing in autumn but not shedding pollen until following spring, borne in spikes of panicles, shortly pedunculate; microsporophylls 15–20, decussate, each with 3 pollen sacs, except apical and basal with 2. Seed cones terminal or subterminal on previous year's growth, solitary, shortly pedunculate at pollination, becoming long pedunculate and pendulous, subglobose, slightly cubic, or occasionally oblong-globose, ripening in 1st year, peduncle clothed with decussate, linear leaves; cone scales 16–24, persistent, decussate, shieldlike, woody, grooved, 5–9-seeded (when fertile), base cuneate, distal part transversely rhombic. Seeds 5–9, compressed-ovoid, winged all round, apex emarginate. Cotyledons 2. Germination epigeal. $2n = 22^*$.

• One species: China.
A relict species of the Cretaceous and Cenozoic, when this genus was widely distributed in what is now NE China, Europe, Greenland, Japan, North America, and Russia (Siberia).

1. Metasequoia glyptostroboides Hu & W. C. Cheng, Bull. Fan Mem. Inst. Biol., n.s., 1: 154. 1948.

水杉 shui shan

Metasequoia glyptostroboides var. *caespitosa* Y. H. Long & Y. Wu; *Sequoia glyptostroboides* (Hu & W. C. Cheng) Weide.

Trees to 50 m tall; trunk buttressed at base, to 2.5 m d.b.h.; bark of young trees pale orange-brown with darker flakes and exfoliating, finally dark reddish brown to gray, fissured; crown narrowly conical or pyramidal, finally broadly conical; branches ascending; branchlets pendulous, axis pinkish green or pale purple in 1st year, later brownish gray; winter buds to 5×3 mm, apex obtuse, scales yellowish brown, ca. $2-2.5 \times 2-2.5$ mm. Lateral branchlets deciduous, opposite, each subtended by leaflike scale, with longer and shorter leaves alternating irregularly, forming an ovate-elliptic outline $3-7 \times 1.5-4$ cm. Leaves borne at $45-60^\circ$ to branchlet axis, 2–5 mm apart, bluish green or yellowish green adaxially, paler abaxially, turning orange or red in autumn, linear, 0.8–1.5 cm \times 1.2–2 mm on old trees but longer on younger trees, stomatal bands 0.4–0.6 mm, indistinct, marginal bands 0.5–0.6 mm wide, apex obtuse or with hyaline mucro, more sharply acute on leaves of leader branchlets. Pollen cones ovoid, $2.5-5.5 \times 2-3.8$ mm; bracts triangular-ovate or obovate, ca. 4×3 mm, lowest minutely ciliate distally, others glabrous. Seed cones purplish black when young, oblong-ellipsoid and to 9×5.5 mm at pollination, subglobose and $1.4-2.5 \times 1.6-2.3$ cm when mature; basal cone scales 9-ovulate, middle 7-ovulate, distal 5-ovulate, apical sterile. Seeds ca. 5×4 mm. Pollination Feb–Mar, before leaves, seed maturity Oct–Nov.

• Riparian habitats on valley floors and in moist ravine bottoms, on acidic, montane yellow-earth soils in regions with moderate climate, high sunshine, and high summer and autumn rainfall, associated with *Castanea henryi*, *Houttuynia cordata*, *Liquidambar acuminata*, *Populus adenopoda*, species of *Pterocarya*, etc.; (750–)1000–1300(–1500) m. SW Hubei (Lichuan Xian), NW Hunan (Longshao Xian, Sangzhi Xian), E Sichuan (Shizhu Xian); also widely cultivated as an ornamental or planted for afforestation in Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Yunnan, Zhejiang.

A rare species as a native plant because the valley floors are now largely under rice cultivation.

Abstract	67
Introduction	68
Updated Classification of Magnoliopsida	69
Pertinent Literature	141

Abstract

The present classification of extant flowering plants (Magnoliopsida) updates and revises those presented previously by bringing together the vast majority of new information published since 1999. The extant members of Magnoliopsida are subdivided into 12 subclasses, 35 superorders, 87 orders, 40 suborders, 472 families, and 400 subfamilies. The number of genera and species for each accepted taxon is indicated, along with a statement of the taxonomic confidence that the taxon is worthy of recognition as outlined. Authorships and year of publication are provided for each accepted name and cited synonym. A rule change adopted in 2005 at the Vienna Botanical Congress has fundamentally altered authorships and valid places of publication for hundreds of names, and the full extent of the changes is unknown at present. Newly proposed names include subclass Malvidae; superorder Berberidopsidanae and Huerteanae; suborders Araliidinae, Asphodelineae, Chloranthinae, Eriocaulinae, Hamamelidinae, Juglandinae, Myricinae, Papaverinae, and Xyridinae; and subfamilies Circaeasteroideae, Dampieroideae, Dasypogonoideae, Davidsonioideae, Ebenoideae, Goetzeoideae, Hesperocalloidoideae, Hortonioideae, Isophysidoideae, Kingdonioideae, Laxmannioideae, Ledocarpoideae, Lilaeoideae, Lomandroideae, Morkillioideae, Oc-

13.1. Valid publication of names for organisms of different groups is treated as beginning at the following dates (for each group a work is mentioned that is treated as having been published on the date given for that group):

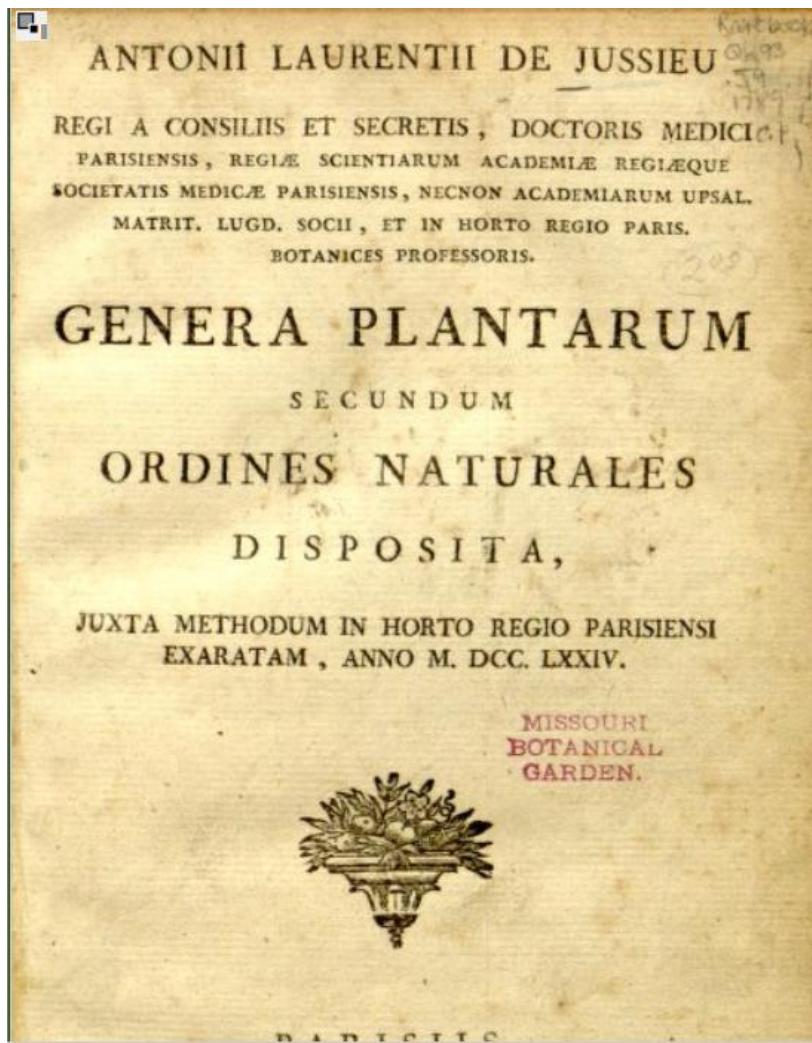

Non-fossil organisms:

(a) SPERMATOPHYTA and PTERIDOPHYTA, names at ranks of genus and below, 1 May 1753 (Linnaeus, *Species plantarum*, ed. 1); suprageneric names, 4 August 1789 (Jussieu, *Genera plantarum*).

41.8. On or after 1 January 1953, in any of the following cases, a full and direct reference to a work other than that in which the basionym or replaced synonym was validly published is treated as an error to be corrected, not affecting the valid publication of a new combination, name at new rank, or replacement name:

- (a) when the name cited as the basionym or replaced synonym was validly published earlier than in the cited publication, but in that cited publication, in which all conditions for valid publication are again fulfilled, there is no reference to the actual place of valid publication;
- (b) when the failure to cite the place of valid publication of the basionym or replaced synonym is explained by the later nomenclatural starting-point for the group concerned, or by the backward shift of the starting date for some fungi;
- (c) when an intended new combination or name at new rank would otherwise be validly published as a (legitimate or illegitimate) replacement name; or
- (d) when an intended new combination, name at new rank, or replacement name would otherwise be the validly published name of a new taxon.

41.8. On or after 1 January 1953, in any of the following cases, a full and direct reference to a work other than that in which the basionym or replaced synonym was validly published is treated as an error to be corrected, not affecting the valid publication of a new combination, name at new rank, or replacement name:

(b) when the failure to cite the place of valid publication of the basionym or replaced synonym is explained by the later nomenclatural starting-point for the group concerned ([Art. 13.1](#)), or by the backward shift of the starting date for some fungi;

Ex. 27. (b). *Malvidae* C. Y. Wu (in *Acta Phytotax. Sin.* 40: 306. 2002) was validly published as a name at new rank based on *Malvaceae* Juss. (Gen. Pl.: 271. 1789), even though Wu cited as the basionym “*Malvaceae*” (Adanson, Fam. Pl. 2: 390. 1763). Wu’s error of citation, explained by the later nomenclatural starting-point for suprageneric names of *Spermatophyta* and *Pteridophyta* ([Art. 13.1\(a\)](#)), does not prevent valid publication of the name at new rank.

Zhu • (062–063) Proposal to amend the Code

TAXON 52 • August 2003: 638

(062)–(063) Proposals to simplify author citation

Xiangyun Zhu

Institute of Botany, Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, People's Republic of China. xiangyunzhu@ns.ibcas.ac.cn

For a long time, I have considered the authorship of the names of new taxa, new combinations and nomina nova published in books. These kinds of situations are different from each other. There may be many authors of editors of a book. Those authors may be the same as, partly the same as, or completely different from the authors of a subsection of that book (e.g., a family account in a flora). Similarly, the authorship ascribed to a name published in that book may have all, some, or no

(034) Proposal to move Appendix I into the main body of the *Code* as Chapter X

Xiang-Yun Zhu

State Key Laboratory of Systematic and Evolutionary Botany, The Chinese Academy of Sciences, 20 Nanxincun, Xiangshan, Beijing 100093, China; xiangyunzhu@ibcas.ac.cn

DOI <http://dx.doi.org/10.12705/636.15>

For the *Melbourne Code* (McNeill & al. in *Regnum Veg.* 154. 2012), the main body of the *Code* together with Appendix I was published simultaneously online and in a printed version, but the remaining Appendices, i.e., App. II–VIII, will be published separately. The present author was astonished by this situation. Why were all Appendices I–VIII not put together?

Historically, "Appendix I" is actually a relic of the *Paris Code* (Lanjouw & al. in *Regnum Veg.* 8. 1956), in which App. I was "Names of hybrids and some special categories", App. II was "Special provisions concerning fossil plants", App. III was "Nomina generica conservanda et rejicienda", App. IV was "Determination of types", and App. V was "Guide to the citation of botanical literature". In the immediately following *Montreal Code* (Lanjouw & al. in *Regnum Veg.* 23. 1961), *Edinburgh Code* (Lanjouw & al. in *Regnum Veg.* 46. 1966), and *Seattle Code* (Stafleu & al. in *Regnum Veg.* 82. 1972), App. I was still "Names of hybrids and some special categories" but App. II and III became "Nomina familiarum conservanda" and "Nomina generica conservanda et rejicienda", respectively, followed by "Guide for the determination of types" and "Guide to the citation of botanical nomenclature" both as separate sections, not as Appendices. The *Leningrad Code* (Stafleu & al. in *Regnum Veg.* 97. 1978) and *Sydney*

Code (Voss & al. in *Regnum Veg.* 111. 1983) were the same except "Guide to the citation of botanical nomenclature" was dropped, and the latter *Code* included a new App. IV "Nomina utique rejicienda". The *Berlin Code* (Greuter & al. in *Regnum Veg.* 118. 1988) dropped "Guide for the determination of types" so that App. I now appeared out of place containing rules and recommendations rather than lists of conserved and rejected names as in the following Appendices. This situation has persisted to the present.

Under the present situation, App. I is very close, logically, to the main body of the *Code*, rather than to the other Appendices (currently App. II–VIII), because it comprises Articles, Notes, Recommendations, and Examples. Within the main body of the *Code*, Art. 3.2, 4.4, 11.9, 20 Note 1, 21 Note 2, 23.6(d), 28 Note 1, 32.4, 32 Note 2, 50.1, and 52 Note 3 are directly related to names of hybrids. Therefore, the present author thinks that there is no reason to place "Appendix I Names of hybrids" in its present position as an Appendix and that it should become Chapter X, comprising Art. 63–74. To move App. I into the main body of the *Code* will help readers more clearly understand the *Code* and the nature and function of the Appendices. The changes proposed are as follows:

Version of Record (identical to print version).

1385

(034) Zhu • App. I

TAXON 63 (6) • December 2014: 1385–1386

(034) Move Appendix I into the main body of the *Code* as Chapter X. Rerumber the Articles such that Art. H.1–H.12 become Art. 63–74, with the Recommendations renumbered accordingly. Rerumber App. II–VIII as App. I–VII. Editorially adjust the relevant cross-references throughout the *Code*.

Acknowledgements

The author is grateful to Dr. J. McNeill for reviewing and correcting the manuscript and to Mr. N.J. Turland for providing a historical review on the Appendices of the *Code*. This work is partially supported by the National Natural Science Foundation of China (Nos. 31270240 and 30970179).

A wide-angle photograph of a mountainous landscape. In the foreground, there's a field of green grass and small purple wildflowers. A dirt road winds its way through the valley. On the left side of the valley, there's a cluster of small, white, dome-shaped yurts. The middle ground shows a valley floor with more green grass and a few more yurts. The background is dominated by a range of mountains with sharp peaks. The sky is blue with some white, wispy clouds.
