More specifically, in the framework of the project, the mechanism and the parameters of this interaction are studied in detail. The aim is the evaluation of the handheld antenna performance degradation and on the other hand the determination of the amount of the RF power absorbed in the human body. The derived results can be used in the optimization of the design and development of new more efficient handheld antennas and on the other hand, respectively, these results can be used to evaluate potential health effects or compliance with appropriate standards. A theoretical EM model has been developed, evaluated and optimized with measurements data that will be derived through a measurement procedure using prototype measuring setup especially developed for this purpose. The measurement methodology is based on far field EM radiation measurements conducted in the anechoic chamber of the Institute using prototype models of mobile phones and phantom-heads, simulating the electromagnetic behavior of the human head in the vicinity of a radiating handset.</p>

It is clear that the main advantage of using digital transmission for audio-video services has been and will be the ability to use less bandwidth and infrastructure for reduced operation expenses per program. The project proposed an innovative concept and system capable of optimising the bandwidth allocation for every service, function of the complexity of the service and based on the perceived quality of the service. The activities concentrated on the development and implementation of key components of the distributed feed back loop bandwidth allocation system, which is the kernel of an open and scalable solution. The proposed architecture is the solution for service providers and mobile operators who demand a flexible and cost-effective method for managing compressed digital services while maximising bandwidth capacity but maintaining the service quality. At the service provider site, the operator is able to select specific services of interest, from a large number of TV and IP</p>

			<p>services, locally generated or arriving at its premises via satellite, terrestrial or cable networks. This solution, available in real time, enables operators to statistically re-multiplex services from a variety of sources and create a new, customised statistical multiplex while optimising bandwidth for delivery of additional tiered services. A prototype, incorporating the developed key building modules, was implemented in order to validate the new technology and to evaluate the performance and the quality of the services.</p> <p>The project contributed towards the interactive broadcasting concept, which aims to bring closer the broadcasting and telecomm operator worlds. In the frame of MAMBO, I.I.T. developed specific parts of an innovative bandwidth management system, operating over a DVB-T network, which is currently imbedded in the equipment and systems of THALES.</p> <p>The know-how and the DVB-T platform that was acquired during this project have been presented to public and private TV broadcasters, in an effort to introduce digital terrestrial TV in Greece. Furthermore, the use and advantages of digital terrestrial TV has been presented to the Greek Government, in order to help towards a more efficient spectrum planning, considering that in a few years, all analog TV stations will have to turn into digital, following the respective directive from the EU.</p>

The objective of project SOQUET was to provide methodologies that allow the definition and provision of a particular quantifiable quality of service (QoS) across heterogeneous networks for all users; individuals, groups, professionals and consumers. The QoS defined relied on the users perceived QoS, in order to manage the resources to meet users end-to-end requirements. This was demonstrated through provision of a QoS management model applied on critically reliable, time critical, band-limited systems. Several services, such as audio/video multicasting over IP, were operated on UMTS and DVB experimental platforms. An Optimisation of network capacity and performance and an increase in network management flexibility was achieved.</p>

			<p>The results of SOQUET directly affect the society, because the tools and methods developed, exploit the QoS as perceived by the end-user. The perceived QoS is objectively measured using special perceived quality meters, imbedded in the user terminal.</p> <p>In the frame of SOQUET, I.I.T. contributed to the design and implementation of method for the real time communication of Perceived Quality Meters (produced by Rohde &amp; Schwartz) with the DVB-T transmission center, in order to adjust the transmission parameters according to the perceived quality at the reception sites. Both the downlink and uplink were based on DVB-S technology. The project included the implementation, testing and validation of the overall network performance for three characteristic types of terrestrial networks : DVB-T, WLAN and ADSL, thus contributing towards the convergence of DVB-S technology with wired and wireless terrestrial networks in an integrated and seamless environment.</p> <p>In the frame of REPOSIT, I.I.T. contributed to the development of some parts of a management system for DVB-S routers to be developed by THALES. This system is important for the guarantee of QoS for IP services, according to their priorities.</p>

ATHENA project considers that if proper decision will be taken for the digital switchover (taking into account the networking aspect of the new television) it will also provide a solution for the second problem (the broadband access for all citizens). It presents an approach towards the solution of the digital switchover that comprises the use of the DVB stream for interconnecting next generation network (NGN) nodes, by the use of regenerative configurations. The utilisation of regenerative configurations enables for the realisation of a virtual common Ethernet backbone that can be exploited by 3G/UMTS and B3G operators and broadcasters, besides enabling for broadband access for all citizens. Such a configuration enables for multi-service capability, as the regenerative DVB-T creates a single access network physical infrastructure, shared by multiple services (i.e. TV programmes, interactive multimedia services, Internet applications, etc.). Validation of such a broadband access for all citizens infrastructure, based on the proper adoption of digital switchover, will be validated in a real condition trial in a medium-sized city. The above trial includes the implementation, testing and validation of a spectrum efficient real time dynamic management of the available bandwidth, for supporting the variety of heterogeneous bit rate services, and of a traffic policy mechanism, for UMTS users on the move, for seamless reception of IP data when transition from one UHF channel (DVB-T stream) to another is required.</p> <p>I.I.T. in co-operation with the CTRC has developed in the city of Heraklion in Crete a large scale DVB-T platform, where citizens are able to see the capabilities of digital terrestrial TV and even receive them in their homes.</p> <p>I.I.T. has continued the efforts to introduce digital terrestrial TV into Greece and demonstrate its capabilities not only for the provision of more TV programs, but also as a networking infrastructure that is able to cover large areas. The efforts extend to organisation of workshops, special meeting events and interviews in the media (TV and radio stations, in newspapers and magazines).</p>

To meet its objectives, the project will rely on an efficient, distributed and open management architecture for the end-to-end delivery chain. The availability and access to resources will be clearly identified, described and controlled all the way along the content distribution chain. The MPEG-21 data model will be used to provide the common support for implementing and managing the resources functionalities.</p> <p>The ENTHRONE project addresses the scalable generation, protection, distribution and usage of multimedia content and resources in geographically distributed environments. ENTHRONE is concerned with end-to-end QoS in terms of performance, at both the user and network levels, and with the mapping between these levels. Adopting the MPEG-21 framework in our project will contribute to implement the <i>Universal Multimedia Access</i> (UMA) concept, which aims at achieving interoperable transparent access to multimedia resources from any type of client terminal or network. A high-level goal of the ENTHRONE project is to bridge the divide between the content provision and the networking worlds, resulting in cross-industry co-ordination on both network and content management issues, and bringing focus to mutually advantageous standards such as MPEG-21.</p> <p>Presently, I.I.T. has developed a heterogeneous platform supporting end to end QoS, based on the concept of ENTHRONE.</p>
