

STORMSHIELD

Solution brief

Stormshield Data Connector

WITH INTEL MCAFEE DLP

Manages encryption features

Protects your information in your business applications

Uses the trusted infrastructure

KEY POINTS ON INTEGRATION

Strengthened security level

Reference in the area of encryption

Automatic application

of security rules

Contextualization

of data encryption

Unification

of administration solutions

ALTERNATIVE APPROACH CONTROL OVER INFORMATION

Combining a DLP system with encryption allows for contextualizing control over information. Given the fact that the source, destination and recipient of data can be identified, encryption is therefore contextualized, based on policies centrally determined beforehand.

Depending on the policies implemented, security rules will be automatically applied without any user action on the data requiring encryption.

This way, the ePO central console allows for a central management of encryption and the DLP software. On top of that, the logs from detection, blocking and encryption operations can be controlled from the ePO central console, which enables the deployment of the Stormshield Data Security agent on workstations equipped with the DLP software.

COMPLEMENTARY PRODUCTS MCAFEE DLP AND STORMSHIELD DATA SECURITY

McAFEE ENDPOINT DLP

- **Identification:** Keywords or regular expressions
- **Classification:** Confidentiality level
- **Reaction:** Encryption or blocking
- **Traceability:** Centralization of end-user information

STORMSHIELD DATA SECURITY

- **Improvement of user experience:** Data encryption is seamless and automatic
- **Implementation of encryption on a larger scale** on user workstations and less sensitive populations
- **Automatic data protection** without any manual action
- **Elimination** of the user risk factor
- **Simplification** of security management
- **Data-centric** with the right level of security
