## 2. General procedure for the synthesis of substrate **1**<sup>[1]</sup>

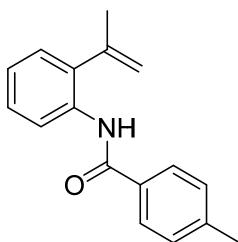

To a suspension of  $\text{PPh}_3\text{MeBr}$  (15 mmol, 1.5 equiv.) in dry THF (30 mL) at 0 °C was added KOtBu (15 mmol, 1.5 equiv) in two portions over 10 min. The resulting yellow mixture was allowed to stir for 30 minutes at room temperature before it was cooled to 0°C again and the corresponding 2'-aminoacetophenone or 2-aminobenzophenone (10 mmol, 1 equiv) was added. After five minutes the cooling bath was removed and the mixture was allowed to warm to ambient temperature. After completion of the reaction the mixture was diluted with EtOAc (20 mL) and sat.  $\text{NaHCO}_3$  (20 mL). The phases were separated and the aqueous phase was extracted with EtOAc ( $2 \times 30$  mL). The combined organic phases were washed with brine, dried over  $\text{Na}_2\text{SO}_4$ , filtered and concentrated under reduced pressure. The resulting residue was loaded on silica and purified via column chromatography to give **1-2**.

To a solution of **1-2** (3.0 mmol) and  $\text{Et}_3\text{N}$  (0.46 g, 4.5 mmol) in  $\text{CH}_2\text{Cl}_2$  (6.0 mL) was added the solution of benzoylchloride (2.5 mL, 3.6 mmol) in dichloromethane (2.0 mL) dropwise at 0 °C. After completion, the reaction mixture was purified via column chromatography to give the pure product **1**.
